

GRADED CHARACTER SHEAVES, HOMFLY-PT HOMOLOGY, AND HILBERT SCHEMES OF POINTS ON \mathbb{C}^2

QUOC P. HO AND PENGHUI LI

ABSTRACT. Using a geometric argument building on our new theory of graded sheaves, we compute the categorical trace and Drinfel'd center of the (graded) finite Hecke category $H_W^{\text{gr}} = \text{Ch}^b(\text{SBim}_W)$ in terms of the category of (graded) unipotent character sheaves, upgrading results of Ben-Zvi–Nadler and Bezrukavnikov–Finkelberg–Ostrik. In type A , we relate the categorical trace to the category of 2-periodic coherent sheaves on the Hilbert schemes $\text{Hilb}_n(\mathbb{C}^2)$ of points on \mathbb{C}^2 (equivariant with respect to the natural $\mathbb{C}^* \times \mathbb{C}^*$ action), yielding a proof of a conjecture of Gorsky–Neguț–Rasmussen which relates HOMFLY-PT link homology and the spaces of global sections of certain coherent sheaves on $\text{Hilb}_n(\mathbb{C}^2)$. As an important computational input, we also establish a conjecture of Gorsky–Hogancamp–Wedrich on the formality of the Hochschild homology of H_W^{gr} .

1. INTRODUCTION

1.1. Motivation. Let G be a (split) reductive group, $T \subseteq B$ a fixed pair of a maximal torus and a Borel subgroup, and W the associated Weyl group. The geometric finite Hecke category associated to G , defined to be the category of B -bi-equivariant sheaves/ D -modules on G , plays a central role in representation theory. Of particular interest to us are results of Bezrukavnikov–Finkelberg–Ostrik (underived) and Ben-Zvi–Nadler (derived) in [BN; BFO] which identify its *categorical trace* and *Drinfel'd center* with the category of *character sheaves* constructed by Lusztig in a series of seminal papers [Lf; Lg; Lh; Li; Lj] as a tool for studying the characters of the finite group $G(\mathbb{F}_q)$.

The finite Hecke category has a *graded* cousin $\mathrm{Ch}^b(\mathrm{SBim}_W)$, the monoidal (DG-)category of bounded chain complexes of Soergel bimodules.¹ Like its geometric counterpart, (variations of) graded finite Hecke categories play an important role in geometric representation theory, especially in Koszul duality phenomena, see, for example [BGS; BY; A+a; LY]. Of particular interest to us is the role these categories play in one construction of the HOMFLY-PT link homology, see [Ka; WWb; T; BT].

It is thus natural to study the categorical trace and Drinfel'd center of $\mathrm{Ch}^b(\mathrm{SBim}_W)$ with an eye toward *both* categorified link invariants and character sheaves. Indeed, the categorical trace has been studied by Beliakova–Putyra–Wehrli and Queffelec–Rose–Sartori (underived) and Gorsky–Hogancamp–Wedrich (derived) in [BPW; QR; QRS; GHW] with applications to HOMFLY-PT link homology. Moreover, it was proposed in [GHW] that an in-depth study of the categorical trace should yield a proof of a conjecture by Gorsky–Neguț–Rasmussen [GNR] which relates HOMFLY-PT link homology and global sections of coherent sheaves on the Hilbert schemes of points $\mathrm{Hilb}_n(\mathbb{C}^2)$ on \mathbb{C}^2 .

Despite their importance in both categorified link homology and geometric representation theory, many questions are still left unanswered by these previous works:

- (i) What is the Drinfel'd center of $\mathrm{Ch}^b(\mathrm{SBim}_W)$?
 - (ii) How are the categorical trace and Drinfel'd center of $\mathrm{Ch}^b(\mathrm{SBim}_W)$ related to the category of character sheaves?
 - (iii) In type A , how are the trace and centers related to the category of coherent sheaves on $\mathrm{Hilb}_n(\mathbb{C}^2)$?
- Indeed, various aspects of these questions have been raised by the experts previously but without a precise answer, see [BN, §1.1.5], [WWa, discussion after Theorem A], [GHW, §1.5], and [GKS, §7.5].

In this paper, we provide complete answers to the questions above (except the center case of part (iii)) and as an application, give a proof of the aforementioned conjecture of Gorsky–Neguț–Rasmussen.² Moreover, as the main computational input for answering question (iii) above, we also establish a conjecture of Gorsky–Hogancamp–Wedrich on the formality of the Hochschild homology

¹Note that the notation is somewhat abusive here since SBim_W depends on the Coxeter system rather than just the Weyl group.

²The link between the Drinfel'd centers and Hilbert schemes of points on \mathbb{C}^2 requires an entirely different technique to establish. The details will appear in a forthcoming paper. We will not need this fact in the current paper. See also Remark 1.5.9.

of $\mathrm{Ch}^b(\mathrm{SBim}_W)$, [GHW, Conjecture 1.7], which is a consequence of the formality of the Grothendieck–Springer sheaf in our geometric setup. This formality conjecture is the main obstacle for [GHW] to make the trace of $\mathrm{Ch}^b(\mathrm{SBim}_W)$ more explicit.

1.2. The approach.

1.2.1. *Categorical traces and Drinfel’d centers.* Unlike [BPW; GHW], our computations of the categorical traces and Drinfel’d centers are completely geometric, inspired by the arguments of Ben-Zvi–Nadler found in [BN] and our previous work [HLA]. This is possible thanks to our new theory of graded sheaves developed in [HLb], which provides a geometric realization of $\mathrm{Ch}^b(\mathrm{SBim}_W)$ (as the category $\mathrm{Shv}_{\mathrm{gr},c}(B \backslash G/B)$ of B -bi-equivariant constructible *graded sheaves* on G) *within a sheaf theory* with weight structures and perverse t -structures and sufficient functoriality to *do geometry and categorical algebra*. Such a theory is indispensable for our strategy since other geometric constructions of $\mathrm{Ch}^b(\mathrm{SBim}_W)$ via $B \backslash G/B$, such as those found in [BGS; R; SVW; ESa], have not been extended to include those spaces such as $\frac{G}{B}$ and $\frac{G}{G}$ (with conjugation actions), geometric objects that appear naturally in the study of categorical traces and Drinfel’d centers.

While the general idea for computing the categorical traces and Drinfel’d centers (see Theorem 1.5.2) is similar to the one in [BN; HLA], the implementation is more involved. This is because compared to quasi-coherent sheaves or D -modules, the categorical Künneth formula fails much more frequently for constructible sheaves. But now, with the modifications done in this paper, the proof of Theorem 1.5.2 works equally well with other sheaf theoretic settings, such as D -modules (which recovers the result of Ben-Zvi–Nadler in [BN]) or sheaves with positive characteristic coefficients (either in the classical analytic topology when the geometric objects involved are defined over \mathbb{C} or in the étale topology when working over \mathbb{F}_q , as long as $\ell \neq p$). We choose to work with ℓ -adic sheaves throughout due to the availability of the theory of graded sheaves in this setting, crucial for applications to Soergel bimodules.

1.2.2. *Formality of Hochschild homologies of Hecke categories.* One interesting feature of our approach to the formality problem conjectured by Gorsky, Hogancamp, and Wedrich in [GHW] is that its solution does not go through the usual “purity implies formality” route. This is not possible since the algebra of derived endomorphisms of the Grothendieck–Springer sheaf is not pure, already for the simplest case when G is a torus. Instead, it relies on a transcendental argument carried out by the second-named author in [La] and a spreading argument. In type A , once the categories of graded unipotent character sheaves are computed explicitly using the formality result, their relation to the Hilbert schemes of points on \mathbb{C}^2 can then be deduced as a combination of Koszul duality and results of [BKR; Kb].

1.2.3. *Hilbert schemes and link invariants.* In terms of link invariants, the categorical trace of $H_{\mathrm{GL}_n}^{\mathrm{gr}}$ is a universal receptacle for (derived) annular link invariants coming out of $H_{\mathrm{GL}_n}^{\mathrm{gr}}$. As such, HOMFLY-PT homology factors through it. Using an argument involving weight structures in the sense of Bondarko and Pauksztello, we prove a co-representability result for the degree- a parts of the HOMFLY-PT homology. Matching the co-representing objects on the Hilbert scheme side, we obtain a proof of a conjecture of Gorsky–Negut–Rasmussen.

Finally, we remark that the use of homotopical/categorical algebra and ∞ -categories as developed in [Ld; Lc; GR] is indispensable to our approach at many levels, from the definitions/constructions of the objects and the formulation of the statements to the actual proofs. While being sophisticated, the theory is packaged in such a clean and convenient way that the arguments presented in this paper can still be followed by readers who are not familiar with it. The readers might also consult [HLb, §3] where most of the relevant background is reviewed.

In the remainder of the introduction section, we will recall the basic objects in §§1.3 & 1.4 and then provide the precise statements of the main results in §1.5.

Remark 1.2.4. Employing completely different techniques involving matrix factorizations, Oblomkov and Rozansky proved the conjecture of [GNR] in a series of papers [ORa; ORc; ORb]. It is not clear to us how their work fits with known results in geometric representation theory revolving around *finite* (as opposed to *affine*) Hecke categories and character sheaves. Our approach, on the other hand,

draws a direct connection between finite Hecke categories, character sheaves, and categorified knot invariants, where the passage from the first to the last one is as in the original construction of HOMFLY-PT homology theory via Soergel bimodules by Khovanov in [Ka]. In fact, our main result is geometric representation theoretic: we compute both the trace and the Drinfel'd center of the graded finite Hecke categories and related them to character sheaves, upgrading previous results of Ben-Zvi–Nadler in [BN] and Bezrukavnikov–Finkelberg–Ostrik in [BFO]. The relation to HOMFLY-PT homology is then deduced as a consequence. On the other hand, already the geometric description of the finite Hecke categories is only conjectural in their framework (see [ORb, Conjecture 7.3.1]).

Their work lives in the *coherent* world whereas our arguments happen in the *constructible* world. Under the Langlands philosophy, there should be a duality between the objects considered in their work and ours. We expect that the two approaches are related via a graded version of Bezrukavnikov's theorem on two geometric realizations of affine Hecke algebras [Ba]. We will revisit this question in a subsequent paper.

1.3. Notation and conventions. Let us now quickly review the basic notation and conventions used throughout the paper.

1.3.1. Category theory. We work within the framework of $(\infty, 1)$ -categories (or more briefly, ∞ -categories) as developed by Lurie in [Ld; Lc]. By default, our categories are all ∞ -categories. In particular, we use the language of DG-categories as developed by Gaitsgory and Rozenblyum in this framework [GR]. See also [HLb, §3] for a quick recap. All of our functors and categories are “derived” by default when it makes sense.

We let $\mathrm{DGCat}_{\mathrm{pres}, \mathrm{cont}}$ denote the category whose objects are presentable DG-categories and whose morphisms are continuous (i.e., colimit preserving) functors. Similarly, we let $\mathrm{DGCat}_{\mathrm{idem}, \mathrm{ex}}$ denote the category whose objects are idempotent complete DG-categories and whose morphisms are exact (i.e., finite colimit and limit preserving) functors. Finally, let $\mathrm{DGCat}_{\mathrm{pres}, \mathrm{cont}, c}$ denote the *1-full* subcategory (see [GR, Volume I, Chapter 1, §1.2.5]) of $\mathrm{DG}_{\mathrm{pres}, \mathrm{cont}}$ whose objects are compactly generated and whose morphisms are quasi-proper functors, i.e., compact preserving functors. Each is equipped with a symmetric monoidal structure—the Lurie tensor product. The operation Ind of taking ind-completion is symmetric monoidal and factors as follows

$$\mathrm{DGCat}_{\mathrm{idem}, \mathrm{ex}} \xrightarrow{\mathrm{Ind}} \mathrm{DGCat}_{\mathrm{pres}, \mathrm{cont}, c} \rightarrow \mathrm{DGCat}_{\mathrm{pres}, \mathrm{cont}}.$$

Moreover, the first functor is an equivalence of categories.

We will informally refer to objects in $\mathrm{DGCat}_{\mathrm{pres}, \mathrm{cont}}$, resp. $\mathrm{DGCat}_{\mathrm{idem}, \mathrm{ex}}$, as “large”/“big”, resp. “small”, categories.

1.3.2. Algebraic geometry. Unless otherwise specified, our stacks are Artin, with smooth affine stabilizers, and are of finite type over \mathbb{F}_{q^n} (or $\overline{\mathbb{F}}_q$, depending on the field of definition). We write $\mathrm{pt}_n = \mathrm{Spec} \mathbb{F}_{q^n}$ and $\mathrm{pt} = \mathrm{Spec} \overline{\mathbb{F}}_q$, where $q = p^k$ for some prime number p . Moreover, for any Artin stack \mathcal{Y} over $\overline{\mathbb{F}}_q$, we usually use \mathcal{Y}_n to denote an \mathbb{F}_{q^n} -form of \mathcal{Y} . We will make heavy use of the theory of graded sheaves developed in [HLb], obtained by categorically semi-simplifying Frobenius actions in the category of mixed sheaves [B+]. All notation involving the theory of graded sheaves will be the same as in [HLb]. We will now recall only the main pieces of notation from there.

As the theory of graded sheaves is built on top of the theory of mixed ℓ -adic sheaves, we fix a prime number $\ell \neq p$ throughout this paper. For any Artin stack \mathcal{Y}_n over \mathbb{F}_{q^n} and \mathcal{Y} its base change to $\overline{\mathbb{F}}_q$, we will use $\mathrm{Shv}_{m, c}(\mathcal{Y}_n)$, $\mathrm{Shv}_m(\mathcal{Y}_n)$, and $\mathrm{Shv}_m(\mathcal{Y}_n)^{\mathrm{ren}} := \mathrm{Ind}(\mathrm{Shv}_{m, c}(\mathcal{Y}_n))$ (resp. $\mathrm{Shv}_{\mathrm{gr}, c}(\mathcal{Y})$, $\mathrm{Shv}_{\mathrm{gr}}(\mathcal{Y})$, and $\mathrm{Shv}_{\mathrm{gr}}(\mathcal{Y})^{\mathrm{ren}} := \mathrm{Ind}(\mathrm{Shv}_{\mathrm{gr}, c}(\mathcal{Y})^{\mathrm{ren}})$) to denote the DG-category of constructible mixed (resp. graded) sheaves, the DG-category of mixed (resp. graded) sheaves, and the renormalized DG-category of mixed (resp. graded) sheaves on \mathcal{Y}_n (resp. \mathcal{Y}). The first one is an object in $\mathrm{Shv}_{m, c}(\mathrm{pt}_n)\text{-Mod}$ (resp. $\mathrm{Vect}^{\mathrm{gr}, c}\text{-Mod}$) whereas the last two are objects in $\mathrm{Shv}_m(\mathrm{pt}_n)\text{-Mod}$ (resp. $\mathrm{Vect}^{\mathrm{gr}}\text{-Mod}$).³ All the usual operations on

³We deviate slightly from the convention used in [HLb]. For example, the category $\mathrm{Vect}^{\mathrm{gr}}\text{-Mod}$ of $\mathrm{Vect}^{\mathrm{gr}}$ -module categories is denoted by $\mathrm{Mod}_{\mathrm{Vect}^{\mathrm{gr}}}$ there.

sheaves, when defined, are linear over these categories. Note that here, $\mathrm{Shv}_{\mathrm{gr}}(\mathrm{pt}) \simeq \mathrm{Vect}^{\mathrm{gr}}$, the (∞ -derived) symmetric monoidal category of graded chain complexes over $\overline{\mathbb{Q}}_\ell$ and $\mathrm{Shv}_{\mathrm{gr},c}(\mathrm{pt}) \simeq \mathrm{Vect}^{\mathrm{gr},c}$, the full symmetric monoidal subcategory consisting of perfect complexes.

$\mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})$ is equipped with a six-functor formalism, a perverse t -structure, and a weight/co- t -structure in the sense of Bondarko and Pauksztello. Moreover, it fits into the following diagram

$$\mathrm{Shv}_{m,c}(\mathcal{Y}_n) \xrightarrow{\mathrm{gr}_{\mathcal{Y}_n}} \mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y}) \xrightarrow{\mathrm{oblv}_{\mathrm{gr}}} \mathrm{Shv}_c(\mathcal{Y})$$

that is compatible with the six-functor formalism, the perverse t -structures, and the Frobenius weights. Moreover, $\mathrm{oblv}_{\mathrm{gr}} \circ \mathrm{ogr}_{\mathcal{Y}_n}$ is simply the pullback functor along $\mathcal{Y} \rightarrow \mathcal{Y}_n$. Roughly speaking, $\mathrm{gr}_{\mathcal{Y}_n}$ turns Frobenius weights into an actual grading and $\mathrm{oblv}_{\mathrm{gr}}$ forgets this grading.

For any $\mathcal{F}, \mathcal{G} \in \mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})$, one can talk about the graded $\mathcal{H}\mathrm{om}$ -space $\mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})}^{\mathrm{gr}}(\mathcal{F}, \mathcal{G}) \in \mathrm{Vect}^{\mathrm{gr}}$, the category of graded (chain complexes) of vector spaces over $\overline{\mathbb{Q}}_\ell$, such that

$$\mathcal{H}\mathrm{om}_{\mathrm{Shv}_c(\mathcal{Y})}(\mathrm{oblv}_{\mathrm{gr}} \mathcal{F}, \mathrm{oblv}_{\mathrm{gr}} \mathcal{G}) \simeq \mathrm{oblv}_{\mathrm{gr}} \mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})}^{\mathrm{gr}}(\mathcal{F}, \mathcal{G}) \simeq \bigoplus_n \mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})}^{\mathrm{gr}}(\mathcal{F}, \mathcal{G})_n$$

where for any $V \in \mathrm{Vect}^{\mathrm{gr}}$, $V_n \in \mathrm{Vect}$ denotes the n -th graded component of V . We also write

$$\mathcal{E}\mathrm{nd}_{\mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})}^{\mathrm{gr}}(\mathcal{F}) := \mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr},c}(\mathcal{Y})}^{\mathrm{gr}}(\mathcal{F}, \mathcal{F}).$$

See [HLb, §3.2.6] for a quick review on enriched Hom-spaces.

Since we always make use of the renormalized categories of sheaves (for example, $\mathrm{Shv}_m(\mathcal{Y}_n)^{\mathrm{ren}}$ and its graded counterpart $\mathrm{Shv}_{\mathrm{gr}}(\mathcal{Y})^{\mathrm{ren}}$) introduced in [A+b] and used extensively in [HLb] rather than the usual categories, we will omit ren from the notation of the various pull and push functors. For example, we will simply write f^* , f_* , $f^!$, and $f_!$ rather than f_{ren}^* , $f_{*,\mathrm{ren}}$, $f_{\mathrm{ren}}^!$, and $f_{!,\mathrm{ren}}$ as in [HLb].

1.3.3. Grading conventions. The different grading conventions appearing in the theory of HOMFLY-PT link homology can be a source of confusion (at least to the authors of the current paper). We will now collect the various gradings convention used in this paper and where they appear. Serving as a point of orientation, this subsection should thus be skipped, to be returned to only when the need arises.

In $\mathrm{Vect}^{\mathrm{gr}}$, we use X to denote the formal grading and C the cohomological grading. Sometimes, to emphasize the grading convention in the presence of other gradings, we also use $\mathrm{Vect}^{\mathrm{gr},X}$ in place of $\mathrm{Vect}^{\mathrm{gr}}$. As most DG-categories in this paper are module categories over $\mathrm{Vect}^{\mathrm{gr}}$, given two objects c_1 and c_2 in such a category \mathcal{C} , the $\mathrm{Vect}^{\mathrm{gr}}$ -enriched Hom, $\mathcal{H}\mathrm{om}_{\mathcal{C}}^{\mathrm{gr}}(c_1, c_2) \in \mathrm{Vect}^{\mathrm{gr}}$ is a graded chain complex. The gradings X and C therefore also apply to $\mathcal{H}\mathrm{om}_{\mathcal{C}}^{\mathrm{gr}}(c_1, c_2)$. We refer to this as the singly graded situation (as the cohomological grading is not a formal grading). This is the *default* grading in the current paper.

The 2-periodic construction in §4.3 allows one to exchange an extra grading with 2-periodization. It is used in §4.4 to introduce an extra grading on (the $\mathcal{H}\mathrm{om}^{\mathrm{gr}}$ in) any $\mathrm{Vect}^{\mathrm{gr}}$ -module category by turning it into a $\mathrm{Vect}^{\mathrm{gr},X,\mathrm{gr},Y}$ -module category. As the notation suggests, the extra grading is denoted by Y . Moreover, all the cohomological shearing and 2-periodization in this paper will be with respect to this Y -grading. In other words, the Y -grading is artificially introduced and then gets “canceled out.”

In §4.4.6, the \tilde{X}, \tilde{Y} -grading is introduced, which is related to the X, Y -grading via a linear change of coordinates. This is the grading that is used in the statements of the main theorems regarding the conjecture of [GNR]. The switch is necessary to match with the usual grading convention on the HOMFLY-PT homology side.

Finally, on the HOMFLY-PT homology, the most natural gradings, from our geometric point of view, are given by Q', A' , and T' , defined in §5.2.4. The relations between Q', A', T', Q, A, T , and q, a, t are also given there, where the last two grading conventions appear in [GKS]. See also Remark 5.2.7 for the source of the difference between Q', A', T' and Q, A, T .

1.4. The main players. We will now recall the definitions of the various objects/constructions that appear in the main results of the paper.

1.4.1. *The various versions of finite Hecke categories.* Let G_1 be a split reductive group over \mathbb{F}_q , equipped with a pair $T_1 \subseteq B_1$ of a maximal torus and a Borel subgroup. Let W be the associated Weyl group. By convention, let G_n , T_n , and B_n denote their pullbacks to \mathbb{F}_{q^n} , and G , T , and B their pullbacks to $\overline{\mathbb{F}}_q$.

While our primary interest lies in the graded finite Hecke category $H_G^{\text{gr}} := \text{Shv}_{\text{gr},c}(B \backslash G/B)$, which is equivalent to $\text{Ch}^b(\text{SBim}_W)$ by [HLb, Theorem 6.4.1],⁴ it is necessary to consider its “big” or renormalized version $H_G^{\text{gr},\text{ren}} := \text{Ind}(H_G^{\text{gr}})$ because the “big” world possesses more functorial symmetries, such as the adjoint functor theorem [Ld, Cor. 5.5.2.9] and the fact that compactly generated (presentable) stable ∞ -categories are dualizable [GR, Volume I, Proposition 7.3.2].⁵ Consequently, we will most of the time start with the renormalized case, from which we deduce the corresponding result for the small variants.

Due to their geometric nature, our arguments apply equally well to other variants of the finite Hecke categories, such as the mixed and ungraded versions, which are of independent interest. For the reader’s convenience, we summarize all the different variants in Table 1 below (see also §1.3.2 for our conventions regarding algebraic geometry).

	Small	Big/Renormalized
Mixed	$H_{G_n}^{\text{m}} := \text{Shv}_{\text{m},c}(B_n \backslash G_n/B_n)$	$H_{G_n}^{\text{m},\text{ren}} := \text{Shv}_{\text{m}}(B_n \backslash G_n/B_n)^{\text{ren}} := \text{Ind}(\text{Shv}_{\text{m},c}(B_n \backslash G_n/B_n)) \simeq \text{Ind}(H_{G_n}^{\text{m}})$
Graded	$H_G^{\text{gr}} := \text{Shv}_{\text{gr},c}(B \backslash G/B)$	$H_G^{\text{gr},\text{ren}} := \text{Shv}_{\text{gr}}(B \backslash G/B)^{\text{ren}} := \text{Ind}(\text{Shv}_{\text{gr},c}(B \backslash G/B)) \simeq \text{Ind}(H_G^{\text{gr}})$
Ungraded	$H_G := \text{Shv}_c(B \backslash G/B)$	$H_G^{\text{ren}} := \text{Shv}(B \backslash G/B)^{\text{ren}} := \text{Ind}(\text{Shv}_c(B \backslash G/B)) \simeq \text{Ind}(H_G)$

TABLE 1. Different versions of finite Hecke categories.

We also will adopt the notation $H_G^{?,\text{ren}}$, $H_G^?$, $\text{Shv}_?(pt)$, and $\text{Shv}_?(\mathcal{Y})$ etc. in statements where $?$ can be gr , m , or nothing (or \emptyset , that is, the ungraded case, e.g., $H_G^? = H_G = \text{Shv}_c(B \backslash G/B)$). In this notation, $H_G^{?,\text{ren}} \in \text{Alg}(\text{Shv}_?(pt)\text{-Mod})$ and $H_G^? \in \text{Alg}(\text{Shv}_{?,c}(pt)\text{-Mod})$. Unless otherwise specified, $?$ can be any of the three.

Remark 1.4.2 (Abuse of notation). Since the subscript n in, for example, G_n , B_n , T_n , and pt_n etc. makes many formulae rather unwieldy, we will, in most cases, drop it altogether when it is not relevant to the discussion. When we do omit the subscript n , the actual value of n is either irrelevant or clear from the context and hence, no confusion should occur. For example, $\text{Shv}_{\text{m}}(BG)^{\text{ren}}$ and $\text{Shv}_{\text{m}}(pt)$ only make sense when we take BG and pt to be BG_n and pt_n , respectively, for some n . Similarly, we will use H_G^{m} and $H_G^{\text{m},\text{ren}}$ rather than the more precise $H_{G_n}^{\text{m}}$ and $H_{G_n}^{\text{m},\text{ren}}$.

Remark 1.4.3. The ungraded renormalized Hecke category H_G^{ren} is larger than the one appearing in [BN]. Ignoring the distinction between D -modules and constructible sheaves, their category corresponds to $\text{Shv}(B \backslash G/B)$, the usual (as opposed to *renormalized*) category of sheaves on $B \backslash G/B$.

1.4.4. *Categorical trace and Drinfel’d center.* As mentioned earlier, the main goal of the current paper is to study the categorical trace and Drinfel’d center of H_G^{gr} . Recall the following definition.

Definition 1.4.5 ([BFN, Definition 5.1]). Let A be an associative algebra object in a closed symmetric monoidal ∞ -category \mathcal{C} .

- (i) The (derived) *trace* or *categorical Hochschild homology* of A , denoted by $\text{Tr}(A) \in \mathcal{C}$, is the relative tensor $A \otimes_{A \otimes A^{\text{rev}}} A$. It comes with a natural universal trace morphism $\text{tr} : A \rightarrow \text{Tr}(A)$ given by $\text{tr}(a) = a \otimes 1_A$.
- (ii) The (derived) *Drinfel’d center* or *categorical Hochschild cohomology* of A , denoted by $Z(A) \in \mathcal{C}$, is the endomorphism object $\underline{\text{End}}_{A \otimes A^{\text{rev}}}(A)$. It comes with a natural central morphism $z : Z(A) \rightarrow A$ given by $z(F) = F(1_A)$.

⁴See also Footnote 1.

⁵Here, “big” refers to the fact that we are working with presentable categories. On the other hand, “renormalized” refers to the fact that we use the renormalized sheaf theory on stacks.

Here, we view A as a bimodule over itself. Moreover, A^{rev} denotes an associative algebra with the same underlying object as A but with reversed multiplications.⁶

Remark 1.4.6. The trace also has a natural S^1 -action. Moreover, the center is naturally equipped with an E_2 -structure (Deligne’s conjecture), i.e., in the case of categories, it has a braided monoidal structure. See [Lc, §§5.3 & 5.5].

Note that $B \setminus G/B \simeq BB \times_{BG} BB$ and the monoidal structures on the various versions of finite Hecke categories are given by $g_! f^*$ (with the appropriate sheaf theory) in the following diagram

$$(1.4.7) \quad BB \times_{BG} BB \times_{BG} BB \xleftarrow[\text{id} \times \Delta \times \text{id}]{f} BB \times_{BG} BB \times_{BG} BB \xrightarrow[p_{13}]{g} BB \times_{BG} BB.$$

Depending on whether we work with the small or big/renormalized versions, these Hecke categories are naturally algebra objects in $\text{Shv}_{\gamma,c}(\text{pt})\text{-Mod}$ or $\text{Shv}_{\gamma}(\text{pt})\text{-Mod}$, where the symmetric monoidal structures of the latter are given by *relative* tensors, see also [HLb, §§3.2 & 3.7]. Their traces and Drinfel’d centers are computed as objects in these symmetric monoidal categories. In other words, the ambient categories \mathcal{C} in Definition 1.4.5 that are relevant to us are the various categories of module categories $\text{Shv}_{\gamma,c}(\text{pt})\text{-Mod}$ or $\text{Shv}_{\gamma}(\text{pt})\text{-Mod}$.

1.5. The main results. We are now ready to formulate the main results of the current paper.

1.5.1. Trace and center of Hecke categories. We start with the computations of the trace and Drinfel’d center. The result below upgrades the main result of Ben-Zvi and Nadler [BN] to the graded setting.

Theorem 1.5.2 (Theorem 2.8.3). *The trace $\text{Tr}(H_G^{?,\text{ren}})$ and center $Z(H_G^{?,\text{ren}})$ of $H_G^{?,\text{ren}}$ coincide with the full subcategory $\text{Ch}_G^{u,?,\text{ren}}$ of $\text{Shv}_{\gamma}(\frac{G}{G})^{\text{ren}}$ generated under colimits by the essential image of $H_G^{?,\text{ren}}$ under $q_! p^*$ in the correspondence*

$$\begin{array}{ccc} & \frac{G}{B} & \\ p \swarrow & & \searrow q \\ B \setminus G/B & & \frac{G}{G}. \end{array}$$

Moreover, under this identification, the canonical trace and center maps are adjoint $\text{tr} \dashv z$ and are identified with the adjoint pair $q_! p^* \dashv p_* q^!$.

The trace $\text{Tr}(H_G^?)$ coincides with the full subcategory $\text{Ch}_G^{u,?}$ of $\text{Ch}_G^{u,?,\text{ren}}$ spanned by compact objects. Namely,

$$\text{Ch}_G^{u,?} := (\text{Ch}_G^{u,?,\text{ren}})^c = \text{Ch}_G^{u,?,\text{ren}} \cap \text{Shv}_{\gamma,c}\left(\frac{G}{G}\right).$$

Equivalently, they are generated under finite colimits and idempotent splittings by the essential image of $H_G^?$ under $q_! p^*$.

The center $Z(H_G^?)$ is the full subcategory $\widetilde{\text{Ch}}_G^{u,?}$ of $\text{Ch}_G^{u,?,\text{ren}}$ spanned by the pre-image of $H_G^?$ under the central functor z .

Remark 1.5.3. We note that the Drinfel’d center of $H_G^?$, that is, working within the context of small categories, is larger than its trace, unlike in the large category setting. This is true already in the case $G = T$ is a torus, see Remark 2.8.4. This seems to be new.

1.5.4. Formality of Hochschild homology. By the description of the trace map above, we see that the image of the unit $\text{tr}(1_{H_G^{\text{gr},\text{ren}}}) \in \text{Ch}_G^{u,\text{gr}}$ is, by definition, the (graded) Grothendieck–Springer sheaf Spr_G^{gr} , a graded refinement of the usual Grothendieck–Springer sheaf, i.e., $\text{oblv}_{\text{gr}}(\text{Spr}_G^{\text{gr}}) \simeq \text{Spr}_G \in \text{Ch}_G^u \subseteq \text{Shv}_c(\frac{G}{G})$. By [G+, Theorem 3.8.5], the graded ring of endomorphisms of this object is the Hochschild homology $\text{HH}(H_G^{\text{gr},\text{ren}})$ of $H_G^{\text{gr},\text{ren}}$, where $H_G^{\text{gr},\text{ren}}$ is viewed as a dualizable object in $\text{Vect}^{\text{gr}}\text{-Mod}$.

⁶In the literature, A^{op} is also used to denote A^{rev} . We opt to use A^{rev} since for a category A , A^{op} is usually already understood as the *opposite* category.

Theorem 1.5.5 (Theorems 2.10.11 and 3.2.1, [GHW, Conjecture 1.7]). *The graded algebra $\mathrm{HH}(\mathrm{H}_G^{\mathrm{gr}, \mathrm{ren}}) \simeq \mathrm{End}_{\mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}, \mathrm{ren}}}(\mathrm{Spr}_G^{\mathrm{gr}}) \in \mathrm{Alg}(\mathrm{Vect}^{\mathrm{gr}})$ is formal. Moreover, we have an equivalence of algebras*

$$\mathrm{End}_{\mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}, \mathrm{ren}}}(\mathrm{Spr}_G^{\mathrm{gr}}) \simeq \mathrm{H}^*(\mathrm{End}_{\mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}, \mathrm{ren}}}(\mathrm{Spr}_G^{\mathrm{gr}})) \simeq (\mathrm{H}_{\mathrm{gr}}^*(BT) \otimes \mathrm{H}_{\mathrm{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W],$$

where $\mathrm{H}_{\mathrm{gr}}^*(-)$ is the functor of taking graded cohomology, i.e., we remember the Frobenius weights on the cohomology (see [HLb, (6.2.1)]), and where the action of $\overline{\mathbb{Q}}_\ell[W]$ on the first factor is induced by the natural actions of W on T and BT .

In type A, a result of Lusztig states that $\mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}}$ is generated by $\mathrm{Spr}_G^{\mathrm{gr}}$. As a consequence, we obtain the following result.

Theorem 1.5.6 (Theorem 3.3.4). *When G is of type A, we have*

$$\mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}} \simeq \mathrm{End}_{\mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}}}(\mathrm{Spr}_G^{\mathrm{gr}})\text{-Mod}(\mathrm{Vect}^{\mathrm{gr}})^c \simeq (\mathrm{H}_{\mathrm{gr}}^*(BT) \otimes \mathrm{H}_{\mathrm{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W]\text{-Mod}(\mathrm{Vect}^{\mathrm{gr}})^{\mathrm{perf}},$$

where for any graded ring $R \in \mathrm{Alg}(\mathrm{Vect}^{\mathrm{gr}})$, $R\text{-Mod}(\mathrm{Vect}^{\mathrm{gr}})$ denotes the category of R -module objects in $\mathrm{Vect}^{\mathrm{gr}}$, i.e., the category of graded R -modules, and the superscript perf denotes the full subcategory spanned by perfect complexes (or equivalently, compact objects).

1.5.7. *Hilbert scheme of points on \mathbb{C}^2 .* While the results above are of independent interest in representation theory, their relation to the HOMFLY-PT link homology and the conjecture of Gorsy–Neguț–Rasmussen is one of our main motivations.

The first link is given by the following result which relates the categories of unipotent character sheaves and Hilbert schemes of points on \mathbb{C}^2 .⁷ It is a consequence of Theorem 1.5.6, Koszul duality, and a result of Krug in [Kb].

Theorem 1.5.8 (Theorem 4.4.15). *When $G = \mathrm{GL}_n$, we have the following equivalence of $\mathrm{Vect}^{\mathrm{gr}_{\tilde{x}}, \mathrm{gr}_{\tilde{y}}, \mathrm{per}}$ -module categories (thus, also as DG-categories)*

$$\Rightarrow \mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}, \mathrm{ren}} \simeq \mathbb{C}[\tilde{x}, \tilde{y}] \otimes \mathbb{C}[S_n]\text{-Mod}_{\mathrm{nilp}_{\tilde{y}}}^{\mathrm{gr}_{\tilde{x}}, \mathrm{gr}_{\tilde{y}}, \mathrm{per}} \xrightarrow{\Psi^{\mathrm{per}}} \mathrm{QCoh}(\mathrm{Hilb}_n / \mathbb{G}_m^2)^{\mathrm{per}}_{\mathrm{Hilb}_{n, \tilde{x}}},$$

and similarly, we have the small variant, which is an equivalence of $\mathrm{Vect}^{\mathrm{gr}_{\tilde{x}}, \mathrm{gr}_{\tilde{y}}, \mathrm{per}, c}$ -module categories

$$\Rightarrow \mathrm{Ch}_G^{\mathrm{u}, \mathrm{gr}} \simeq \widetilde{\mathcal{B}}_n^{\mathrm{gr}}\text{-Mod}_{\mathrm{nilp}_{\tilde{y}}}^{\mathrm{gr}_{\tilde{x}}, \mathrm{gr}_{\tilde{y}}, \mathrm{per}} \xrightarrow{\Psi^{\mathrm{per}}} \mathrm{Perf}(\mathrm{Hilb}_n / \mathbb{G}_m^2)^{\mathrm{per}}_{\mathrm{Hilb}_{n, \tilde{x}}}.$$

Here,

- (i) $\mathrm{Vect}^{\mathrm{gr}_{\tilde{x}}, \mathrm{gr}_{\tilde{y}}, \mathrm{per}}$ denotes the category of 2-periodic bi-graded chain complexes (see Definition 4.4.11 for the precise definition);
- (ii) \tilde{x} and \tilde{y} are multi-variables (that is, \tilde{x} denotes $\tilde{x}_1, \dots, \tilde{x}_n$ and similarly for \tilde{y}), living in cohomological degree 0 and bi-graded degrees $(1, 0)$ and $(0, 2)$ respectively;
- (iii) similarly, the action of \mathbb{G}_m^2 on Hilb_n is induced by its action on \mathbb{A}^2 , scaling the two axes with weights $(1, 0)$ and $(0, 2)$, respectively;
- (iv) the subscript $\mathrm{nilp}_{\tilde{y}}$ indicates the fact that we only consider the full subcategories where the variables \tilde{y} act (ind-)nilpotently;
- (v) the subscript $\mathrm{Hilb}_{n, \tilde{x}}$ indicates the fact that we only consider quasi-coherent sheaves with set-theoretic supports on the closed subscheme of Hilb_n consisting of points supported on the first axis of \mathbb{A}^2 (see §4.2.9 for the precise definition); and
- (vi) the superscripts \Rightarrow and per denote cohomological shear and 2-periodization constructions (see §§4.3 & 4.4 for an in-depth discussion on these constructions and Definition 4.4.10 for the definitions of the 2-periodized categories of sheaves on the Hilbert schemes).

⁷Strictly speaking, the Hilbert schemes that appear in our paper are over $\overline{\mathbb{Q}}_\ell$. However, as fields, we have an abstract isomorphism $\mathbb{C} \simeq \overline{\mathbb{Q}}_\ell$. We will elide this inconsequential difference in the introduction section.

Remark 1.5.9. Theorem 1.5.8 above establishes the relation between the categorical trace of $H_{\text{GL}_n}^{\text{gr}}$ and the category of coherent sheaves on Hilb_n set-theoretically supported “on the x -axis.” The center, on the other hand, corresponds to the whole category of coherent sheaves on Hilb_n *without any support condition*. The details will appear in a forthcoming paper.

1.5.10. *HOMFLY-PT link homology.* Using an argument involving weight structures in the sense of Bondarko and Pauksztello, we prove a co-representability result for the degree a -parts of the HOMFLY-PT homology. Matching the co-representing objects on the Hilbert scheme side, we obtain a proof of the conjecture of Gorsky–Negut–Rasmussen.

Theorem 1.5.11 (Theorem 5.4.6, [GKS, Conjecture 7.2.(a)]). *For any $R_\beta \in H_n^{\text{gr}}$ associated to a braid β , there exists a natural $\mathcal{F}_\beta \in \text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)_{\text{Hilb}_{n,\underline{x}}}^{\text{per}}$ such that the a -degree a component of the HOMFLY-PT homology of β is given by*

$$\mathcal{H}\text{om}_{\text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)_{\text{Hilb}_{n,\underline{x}}}^{\text{per}}}^{\text{gr}_{\tilde{X}}, \text{gr}_{\tilde{Y}}}(\wedge^a \mathcal{T}^{\text{per}}, \mathcal{F}_\beta),$$

where \mathcal{T} is the tautological bundle. The two formal gradings (denoted by \tilde{X} and \tilde{Y}) coming from the \mathbb{G}_m^2 action coincide with q and \sqrt{t} . Moreover, the cohomological degree corresponds to \sqrt{qt} .

See Theorem 5.4.6 for a more precise formulation.

Remark 1.5.12. Theorem 1.5.8 relates the category of graded unipotent character sheaves for GL_n with the 2-periodic category of (quasi-)coherent sheaves on Hilb_n , equivariant with respect to the scaling \mathbb{G}_m^2 -action. As there is only *one* formal grading on the character sheaf side compared to the two \mathbb{G}_m actions on the Hilbert scheme side, 2-periodicity is unavoidable to relate the two. Because of this, our theorem regarding link invariants above relates HOMFLY-PT homology and 2-periodic quasi-coherent sheaves on Hilbert schemes. The same phenomenon also appeared in the work of Oblomkov and Rozansky.

1.5.13. *Support of \mathcal{F}_β .* Thanks to the Hilbert–Chow morphism, $\text{Hilb}_n \rightarrow \mathbb{A}^{2n} // S_n$, the geometric realization of HOMFLY-PT link homology given in Theorem 1.5.11 implies that it admits an action of the algebra of symmetric functions in n variables. More algebraically, the definition of HOMFLY-PT homology via Soergel bimodules also affords such an action (see, for example, [GKS, §5.1]). We show that these two are the same.

Theorem 1.5.14 (Theorem 5.5.1, part of [GKS, Conjecture 7.2.(b)]). *The two actions above coincide.*

Theorem 1.5.14 is a statement about the “global” property of \mathcal{F}_β as it contains information about \mathcal{F}_β after pushing forward to $\mathbb{A}^{2n} // S_n$. More precisely, by [GKS, §5.1], the supports of the various a -degree parts of the HOMFLY-PT homology of a braid β for various a ’s, as a sheaf over $\mathbb{A}^n // S_n$, can be bounded above using the number of connected components of the link associated to β .

The support of \mathcal{F}_β over Hilb_n itself is, however, a more local (and hence, more refined) property. To prove a similar statement, we have to start by transporting the corresponding support condition on the Rouquier complex R_β . However, this does not quite make sense since there is no quasi-coherent sheaf involved at this stage yet. To circumvent this difficulty, we formulate this support condition using module category structures and the notion of support developed by Benson–Iyengar–Krause and Arinkin–Gaitsgory in [BIK; AG]. Transporting this structure around to the Hilbert scheme side, where it coincides with the usual notion of support, we obtain the desired statement.

Theorem 1.5.15 (Theorem 5.6.4, [GKS, Conjecture 7.2.(b) and (c)]). *Let β be a braid on n strands. Then the support of \mathcal{F}_β (as a sheaf over Hilb_n) given in Theorem 1.5.11 can be bounded above using the number of connected components of the link obtained by closing up β . See Theorem 5.6.4 for a more precise formulation.*

1.6. **An outline of the paper.** We will now give an outline of the paper. In §2, we study the categorical traces and Drinfel’d centers of the various variants of the finite Hecke categories and relate them to the theory of character sheaves. In §3, we prove the formality result for the graded Grothendieck–Springer sheaf, of which formality of the Hochschild homologies of the graded finite Hecke categories

is a consequence. In type A, this result gives an explicit description of the categorical trace of $H_n^{\text{gr},(\text{ren})}$. This is followed by §4, where the relation between unipotent character sheaves and Hilbert schemes of points on \mathbb{C}^2 is established. Finally, the paper concludes with a proof of the conjectures by Gorsky–Neguț–Rasmussen in §5.

We note that the different sections are largely independent of each other, both in terms of techniques and results. More precisely, the sections can be grouped as follows: (§2), (§3), (§§4 & 5). The reader can read each group mostly independently, referring to the other parts of the paper mostly to look up the notation only.

2. CATEGORICAL TRACES AND DRINFEL'D CENTERS OF (GRADED) FINITE HECKE CATEGORIES

This section is dedicated to the proof of the first main theorem, Theorem 1.5.2 (which appears as Theorem 2.8.3 below), which relates the categorical trace and Drinfel'd center of a finite Hecke category and the category of unipotent character sheaves. We work with mixed, graded, and ungraded versions and in both settings of “big” and “small” categories. One interesting feature is that the trace and center of a “big” (also known as *renormalized*) finite Hecke category coincide whereas the center of the “small” version is larger than its trace.

In what follows, §2.1 reviews basic definitions and outlines the basic strategy. In §§2.2 & 2.3, we study the categorical analog of Künneth formula for finite orbit stacks and the Beck–Chevalley condition, respectively. As the trace/center is computed by the colimit/limit of a certain simplicial/co-simplicial category, the categorical Künneth formula allows one to interpret each term in the (co-)simplicial diagram algebro-geometrically whereas the Beck–Chevalley condition acts as a descent-type result which allows one to realize the colimit/limit more concretely in terms of sheaves on some space. In §2.4, we formulate the monoidal structure of finite Hecke categories in terms of 1-manifolds, which is then used in §2.5 to formulate the cyclic bar simplicial category computing the trace of a finite Hecke category in terms of the geometry of a circle. The geometric formulation developed thus far is applied in §2.6 to verify the Beck–Chevalley conditions in a uniform way. The computations of the traces and centers conclude in §2.7. In §2.8, we introduce the various versions of the category of (graded) unipotent character sheaves and state our main results thus far in terms of these categories. In §2.9, we show that $\text{Tr}(H_G^{\text{gr}})$ inherits the weight and perverse t -structure from the ambient category $\text{Shv}_{\text{gr},c}(G/G)$. Finally, §2.10, which is mostly independent from the rest of the paper, deduces several consequences about the trace and center of a finite Hecke category from the rigidity of the latter.

2.1. Preliminaries. We will now review the basic definitions of the objects involved and outline the strategy employed to prove Theorem 1.5.2.

2.1.1. Generalities regarding big vs. small categories. In the situation of Definition 1.4.5, the trace $\text{Tr}(A) = A \otimes_{A \otimes A^{\text{rev}}} A$ can be computed as the geometric realization (i.e., colimit) of the simplicial object obtained from the cyclic bar construction. Namely,

$$\text{Tr}(A) = |A^{\otimes(\bullet+1)}| := \text{colim} A^{\otimes(\bullet+1)},$$

where the last face map is given by multiplying the last and first factors of A and where the other face maps are given by multiplying adjacent A factors. See also [BFN, §5.1.1] and [Lc, Remark 5.5.3.13].

The small and big category settings are related by taking Ind via the following standard result.

Proposition 2.1.2 ([BN, Corollary 3.6 and Proposition 3.3]). *Let $\mathcal{A} \in \text{Alg}(\text{DGCat}_{\text{pres},\text{cont}})$ be a compactly generated rigid monoidal category (see [BN, Definition 3.1]). Taking Ind -completion (resp. passing to right adjoints, resp. passing to the full subcategory $(-)^c$ spanned by compact objects) induces a canonical equivalence (i) \rightarrow (ii) (resp. (ii) \rightarrow (iii), resp. (ii) \rightarrow (i)), where*

- (i) *the category $\mathcal{A}^c\text{-Mod}$ of \mathcal{A}^c -module categories in $\text{DGCat}_{\text{idem},\text{ex}}$ where \mathcal{A}^c is full subcategory of \mathcal{A} spanned by compact objects;*
- (ii) *the category $\mathcal{A}\text{-Mod}_c$ of \mathcal{A} -module categories in $\text{DGCat}_{\text{pres},\text{cont},c}$;*
- (iii) *the opposite of the category of \mathcal{A} -module categories in the category of compactly generated DG-categories with morphisms being co-continuous (i.e., limit preserving) and continuous functors.*

As mentioned earlier, we will work mostly in the setting of Proposition 2.1.2.(ii) even though we are most interested in the “small” setting described in Proposition 2.1.2.(i) because the former has more functoriality.

Remark 2.1.3. This result was also proved (but not explicitly stated) in [GR, Volume I, Chapter 1, §9]. Note also that [BN] proved the result above more generally for semi-rigid monoidal categories. We do not need this level of generality here.

Remark 2.1.4. In the literature, the property of being rigid is usually applied to a “small” monoidal DG-category. By definition, a category $\mathcal{C}_0 \in \text{Alg}(\text{DGCat}_{\text{idem,ex}})$ is *rigid* if all objects $c \in \mathcal{C}_0$ have left and right duals. By [GR, Volume I, Chapter 1, Lemma 9.1.5], such a category \mathcal{C}_0 is rigid if and only if $\mathcal{C} := \text{Ind}(\mathcal{C}_0)$ is rigid in the sense of [GR, Volume I, Chapter 1, Definition 9.1.2]. In this case, \mathcal{C} is compactly generated by definition.

We use the term rigid for both “big” and “small” categories. The context should make it clear in which sense we use the term.

2.1.5. *Computing colimits.* Recall that $\text{Ind} : \text{DGCat}_{\text{idem,ex}} \rightarrow \text{DGCat}_{\text{pres,cont}}$ preserves all colimits by [GR, Volume I, Chapter 1, Corollary 7.2.7] and that the forgetful functor $\mathcal{A}\text{-Mod} \rightarrow \text{DGCat}_{\text{pres,cont}}$ preserves all colimits by [Lc, Corollaries 4.2.3.5]. Proposition 2.1.2 then implies that the colimit $\text{colim}_{i \in I} \mathcal{C}_i^0$ of a diagram $I \rightarrow \mathcal{A}^c\text{-Mod}$ can be computed as

$$\text{colim}_{i \in I} \mathcal{C}_i^0 \simeq (\text{colim}_{i \in I} \text{Ind}(\mathcal{C}_i^0))^c,$$

where $(-)^c$ denotes the procedure of taking the full subcategory spanned by compact objects. Moreover, the category underlying the colimit on the right-hand side can be computed in $\text{DGCat}_{\text{pres,cont}}$.⁸

2.1.6. *Computing limits.* Recall that the forgetful functors $\mathcal{A}\text{-Mod} \rightarrow \text{DGCat}_{\text{pres,cont}}$ and $\text{DGCat}_{\text{pres,cont}} \rightarrow \text{Cat}$ preserves all limits by [Lc, Corollary 4.2.3.3] and [Ld, Proposition 5.5.3.13], where Cat denotes the category of all $(\infty, 1)$ -categories. The underlying category of a limit in $\mathcal{A}\text{-Mod}$ can thus be computed in the category of all categories.

However, Ind does not preserve limits. In fact, this is the reason why the renormalized category of sheaves on a stack differs from the usual category. Moreover, as we shall see, this will also be responsible for the fact that the Drinfel’d center of the “small” version of a finite Hecke category differs from its trace.

2.1.7. *The strategy.* The trace of $H_G^{?,\text{ren}}$ as an algebra object in $\text{Shv}_?(pt)\text{-Mod}$ is given by the geometric realization of the cyclic bar construction

$$(2.1.8) \quad \text{Tr}(H_G^{?,\text{ren}})_\bullet := (H_G^{?,\text{ren}})^{\otimes_{\text{Shv}_?(pt)}(\bullet+1)} \simeq H_G^{?,\text{ren}} \otimes_{\text{Shv}_?(pt)} H_G^{?,\text{ren}} \otimes_{\text{Shv}_?(pt)} \cdots \otimes_{\text{Shv}_?(pt)} H_G^{?,\text{ren}} \in (\text{Shv}_?(pt)\text{-Mod})^{\Delta^{\text{op}}}.$$

In the next two subsections, we will discuss the two main technical ingredients used to understand the geometric realization of the simplicial object above. First, the categorical Künneth formula for finite orbit stacks allows one to realize the terms in the simplicial object above as the categories of sheaves on certain stacks. Second, the Beck–Chevalley condition on a simplicial category is essentially a descent-type result that allows one to realize its geometric realization as a full subcategory of a more concrete category.

By a duality argument, we show that the Drinfel’d center of $H_G^{?,\text{ren}}$ coincides with its trace. Finally, the traces and Drinfel’d centers of the small versions $H_G^?$ are obtained from those of the renormalized versions.

⁸Note, however, that colimits in the presentable setting are different from colimits in the category of all ∞ -categories.

2.2. Categorical Künneth formula for finite orbit stacks. This subsection is dedicated to the following result.

Proposition 2.2.1. *Let \mathcal{Y}_n and \mathcal{Z}_n be Artin stacks over pt_n . Suppose that \mathcal{Y}_n is a finite orbit stack. Then, the external tensor product*

$$(2.2.2) \quad \mathrm{Shv}_?(\mathcal{Y})^{\mathrm{ren}} \otimes_{\mathrm{Shv}_?(\mathrm{pt})} \mathrm{Shv}_?(\mathcal{Z})^{\mathrm{ren}} \xrightarrow[\simeq]{\boxtimes} \mathrm{Shv}_?(\mathcal{Y} \times \mathcal{Z})^{\mathrm{ren}}$$

induces an equivalence of categories.

Proof. We will treat the mixed case, i.e., $? = m$. The graded and ungraded cases can be treated similarly.

By [A+b, (F.18)], we know that (2.2.2) is fully faithful. By [HLb, Corollary 3.4.13], we know that the left hand side of (2.2.2) is generated by objects of the form $\mathcal{F}_n \boxtimes \mathcal{G}_n$ where \mathcal{F}_n and \mathcal{G}_n are constructible. Since (2.2.2) is continuous, it suffices to show that $\mathcal{F}_n \boxtimes \mathcal{G}_n \in \mathrm{Shv}_m(\mathcal{Y}_n \times_{\mathrm{pt}_n} \mathcal{Z}_n)^{\mathrm{ren}}$ generates the category. Using excision and the fact that \mathcal{Y}_n is a finite orbit stack, we reduce to the case where $\mathcal{Y}_n = BH_n$ for a (smooth) algebraic group H_n over \mathbb{F}_{q^n} . This case is treated in Lemma 2.2.3 below. \square

Lemma 2.2.3. *Proposition 2.2.1 holds in the case $\mathcal{Y}_n = BH_n$, where H_n is a smooth algebraic group over pt_n .*

Proof. It suffices to show that

$$\mathrm{Shv}_{m,c}(BH_n) \otimes_{\mathrm{Shv}_{m,c}(\mathrm{pt}_n)} \mathrm{Shv}_{m,c}(\mathcal{Z}_n) \xrightarrow{\boxtimes} \mathrm{Shv}_{m,c}(BH_n \times_{\mathrm{pt}_n} \mathcal{Z}_n)$$

is an equivalence of categories.

By descent along the surjective smooth map $\mathcal{Z}_n \rightarrow BH_n \times_{\mathrm{pt}_n} \mathcal{Z}_n$ (using the $(-)^!$ -functor), we have

$$\mathrm{Shv}_{m,c}(BH_n \times_{\mathrm{pt}_n} \mathcal{Z}_n) \simeq \mathrm{Tot}(\mathrm{Shv}_{m,c}(H_n^{\times_{\mathrm{pt}_n}} \bullet \times_{\mathrm{pt}_n} \mathcal{Z}_n)).$$

Then, [Lc, Proposition 4.7.5.1] provides an equivalence of categories

$$(2.2.4) \quad \mathrm{Shv}_{m,c}(BH_n \times_{\mathrm{pt}_n} \mathcal{Z}_n) \simeq ((\pi_n)_!(\pi_n)^! \overline{\mathbb{Q}}_\ell) \text{-Mod}(\mathrm{Shv}_{m,c}(\mathcal{Z}_n))$$

where $\pi_n : H_n \rightarrow \mathrm{pt}_n$ and where $(\pi_n)_!(\pi_n)^! \overline{\mathbb{Q}}_\ell \in \mathrm{Alg}(\mathrm{Shv}_{m,c}(\mathrm{pt}_n))$. Note that here, the algebra structure on $(\pi_n)_!(\pi_n)^! \overline{\mathbb{Q}}_\ell$ is obtained from the multiplication structure of H : indeed, $(\pi_n)_!(\pi_n)^! \overline{\mathbb{Q}}_\ell$ is the homology $C_*(H) := \pi_! \pi^! \overline{\mathbb{Q}}_\ell$ of H along with a Frobenius action, where $\pi : H \rightarrow \mathrm{pt}$ is the pullback of π_n . (2.2.4) can thus be rewritten in the following more familiar form

$$\mathrm{Shv}_{m,c}(BH_n \times_{\mathrm{pt}_n} \mathcal{Z}_n) \simeq C_*(H) \text{-Mod}(\mathrm{Shv}_{m,c}(\mathcal{Z}_n)).$$

Note also that the action of $\mathrm{Shv}_{m,c}(\mathrm{pt}_n)$ on $\mathrm{Shv}_{m,c}(\mathcal{Z}_n)$ is used to make sense of the RHS of (2.2.4).

Arguing similarly, we see that (see also [GR, Volume I, Chapter 1, Proposition 8.5.4])

$$\begin{aligned} \mathrm{Shv}_{m,c}(BH_n) \otimes_{\mathrm{Shv}_{m,c}(\mathrm{pt}_n)} \mathrm{Shv}_{m,c}(\mathcal{Z}_n) &\simeq C_*(H) \text{-Mod}(\mathrm{Shv}_{m,c}(\mathrm{pt}_n)) \otimes_{\mathrm{Shv}_{m,c}(\mathrm{pt}_n)} \mathrm{Shv}_{m,c}(\mathcal{Z}_n) \\ &\simeq C_*(H) \text{-Mod}(\mathrm{Shv}_{m,c}(\mathcal{Z}_n)). \end{aligned}$$

The proof thus concludes. \square

2.3. Beck–Chevalley condition. We will now turn to the Beck–Chevalley condition, a technical condition that allows one to realize geometric realizations (i.e., colimits of simplicial objects) and totalizations (i.e., limits of co-simplicial objects) of categories in more concrete terms.

Definition 2.3.1 ([Lc, Definition 4.7.4.13]). Given a diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{H} & \mathcal{D} \\ \downarrow V & & \downarrow V' \\ \mathcal{C}' & \xrightarrow{H'} & \mathcal{D}' \end{array}$$

which commutes up to a specified equivalence $\alpha : V' \circ H \xrightarrow{\simeq} H' \circ V$.

We say that this diagram is *horizontally left* (resp. *right*) *adjointable* if H and H' admit left (resp. right) adjoints H^L and H'^R (resp. H^R and H'^L), respectively, and if the composite transformation

$$\begin{aligned} H'^L \circ V' &\rightarrow H'^L \circ V' \circ H \circ H^L \xrightarrow{\alpha} H'^L \circ H' \circ V \circ H^L \rightarrow V \circ H^L \\ \text{(resp. } V \circ H^R &\rightarrow H'^R \circ H' \circ V \circ H^R \xrightarrow{\alpha^{-1}} H'^R \circ V' \circ H \circ H^R \rightarrow H'^R \circ V') \end{aligned}$$

is an equivalence.

We say that this diagram is *vertically left* (resp. *right*) *adjointable* if the transposed diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{V} & \mathcal{C}' \\ \downarrow H & & \downarrow H' \\ \mathcal{D} & \xrightarrow{V'} & \mathcal{D}' \end{array}$$

is *horizontally left* (resp. *right*) *adjointable*.

Remark 2.3.2. What we call horizontally left (resp. right) adjointable is simply called left (resp. right) adjointable in [Lc]. This condition on a commutative square of categories is also commonly called the Beck–Chevalley condition.

We are now ready to state the main statement of this subsection.

Proposition 2.3.3 (Lurie). *Let $\mathcal{C}_\bullet : \Delta_+^{\text{op}} \rightarrow \text{DGCat}_{\text{pres,cont}}$ be an augmented simplicial diagram of DG-categories. Let $\mathcal{C} = \mathcal{C}_{-1}$, $F : \mathcal{C}_0 \rightarrow \mathcal{C}$ be the obvious functor, and G its right adjoint. Suppose that for every morphism $\alpha : [n] \rightarrow [m]$ in Δ_+ which induces a morphism $\alpha_+ : [n+1] \simeq [0] * [n] \rightarrow [0] * [m] \simeq [m+1]$, the diagram*

$$(2.3.4) \quad \begin{array}{ccc} \mathcal{C}_{m+1} & \xrightarrow{d_0} & \mathcal{C}_m \\ \downarrow & & \downarrow \\ \mathcal{C}_{n+1} & \xrightarrow{d_0} & \mathcal{C}_n \end{array}$$

is vertically right adjointable. Then, the functor $\theta : |\mathcal{C}_\bullet|_{\Delta^{\text{op}}} \rightarrow \mathcal{C}$ is fully faithful. When G is conservative, then θ is an equivalence of categories.

Proof. We will deduce this proposition from its dual version [Lc, Corollary 4.7.5.3].

Passing to right adjoints, we get an augmented co-simplicial object \mathcal{C}^\bullet . Note that for each n , $\mathcal{C}^n \simeq \mathcal{C}_n$ as only the functors change. By [Ld, Corollary 5.5.3.4] (see also [GR, Volume I, Chapter 1, Proposition 2.5.7]), we have a canonical equivalence of categories

$$|\mathcal{C}_\bullet|_{\Delta^{\text{op}}} \simeq \text{Tot}(\mathcal{C}^\bullet|_\Delta).$$

Moreover, the canonical functor $\mathcal{C} \rightarrow \text{Tot}(\mathcal{C}^\bullet|_\Delta)$ is the right adjoint θ^R of θ .

Observe that

$$\begin{array}{ccc} \mathcal{C}^{m+1} & \xleftarrow{d^0} & \mathcal{C}^m \\ \uparrow & & \uparrow \\ \mathcal{C}^{n+1} & \xleftarrow{d^0} & \mathcal{C}^n \end{array}$$

is horizontally left adjointable as this is equivalent to (2.3.4) being vertically right adjointable. Thus, [Lc, Corollary 4.7.5.3] implies that θ is a fully faithful embedding, and moreover, it is an equivalence of categories when G is conservative. \square

Remark 2.3.5. The same proof goes through when we replace $\text{DGCat}_{\text{pres,cont}}$ by $\mathcal{A}\text{-Mod}$ where \mathcal{A} is a rigid monoidal category, for example, when \mathcal{A} is $\text{Shv}_m(\text{pt}_n)$ or $\text{Vect}^{\text{gr}} \simeq \text{Shv}_{\text{gr}}(\text{pt})$. This is because the forgetful functor $\mathcal{A}\text{-Mod} \rightarrow \text{DGCat}_{\text{pres,cont}}$ preserves all limits and colimits, by [Lc, Corollaries 4.2.3.3 and 4.2.3.5], and adjoints of an \mathcal{A} -linear functor are automatically \mathcal{A} -linear by [HLb, Corollary 3.4.7].

2.4. $H_G^{?,\text{ren}}$ as a functor out of 1-manifolds. While it is straightforward how to apply Proposition 2.2.1, the verification of the adjointability conditions (a.k.a. Beck–Chevalley conditions) necessary for the application of Proposition 2.3.3 is more subtle. The argument can be made transparent by reformulating the simplicial object (2.1.8) geometrically in terms of 1-manifolds. In preparation for that, we will, in this subsection, upgrade $H_G^{?,\text{ren}}$ to a right-lax symmetric monoidal functor coming out of the category of 1-manifolds. The construction found in this subsection is a simplification of the one found in [HLa].

2.4.1. 1-manifolds and their boundaries. Let Mnfd_1 denote the symmetric monoidal ∞ -category of finite 1-dimensional manifolds with morphisms given by embeddings and the symmetric monoidal structure being given by disjoint unions. Note that the objects are simply finite disjoint unions of lines and circles. Although these manifolds are, technically speaking, without boundary, we will make use of their “boundaries” in our construction. We will now explain what this means.

Let Mnfd'_1 be the ∞ -category of compact 1-manifolds, usually denoted by M , with possibly non-empty boundary, denoted by ∂M , such that $\bar{M} := M \cup \partial M \in \text{Mnfd}_1$. Moreover, morphisms are given by (necessarily closed) embeddings. Taking the interior gives a natural functor of ∞ -categories

$$F : \text{Mnfd}'_1 \rightarrow \text{Mnfd}_1, \quad M \mapsto \bar{M}.$$

Lemma 2.4.2 ([HLa, Lemma 2.4.10]). *The functor F is an equivalence of categories. We write $M \mapsto \bar{M}$ denote an inverse of F .*

Because of this equivalence, we will generally not make a distinction between 1-manifolds without boundaries and compact 1-manifolds with possibly non-empty boundaries, unless confusion is likely to occur. For instance, when $M \in \text{Mnfd}_1$, by abuse of notation,

$$\partial M := \partial \bar{M} := \bar{M} \setminus M$$

is used to denote the boundary of \bar{M} .

We also use Disk_1 to denote the full subcategory of Mnfd_1 consisting of just lines. Moreover, the category $\text{Disk}'_1 := \text{Disk}_1 \times_{\text{Mnfd}_1} \text{Mnfd}'_1$ consisting of compact line segments is equivalent to Disk_1 itself.

2.4.3. $H_G^{?,\text{ren}}$ as a functor out of Mnfd_1 . Following [HLa, §3.1.2], we will now construct a right-lax symmetric monoidal functor

$$H_G^{?,\text{ren}} : \text{Mnfd}_1 \rightarrow \text{Shv}_?(pt)\text{-Mod},$$

whose restriction to Disk_1 is symmetric monoidal. The functor $H_G^{?,\text{ren}}$ is obtained as a composition⁹

$$(2.4.4) \quad \text{Mnfd}_1 \xrightarrow{M} \text{Corr}(\text{Stk})_{\text{prop;sm}} \xrightarrow{\text{Shv}_{?,1}^{*,\text{ren}}} \text{Shv}_?(pt)\text{-Mod}.$$

We will now explain the various functors and categories that appear in the diagram above. We start with the functor M , which is defined as the composition

$$(2.4.5) \quad \text{Mnfd}_1 \xrightarrow{B} \text{Corr}((\text{Spc}_{\text{fin}}^{\Delta^1})^{\text{op}}) \xrightarrow{\mathcal{M}\text{ap}} \text{Corr}(\text{Stk}).$$

2.4.6. Correspondences. For any category \mathcal{C} , $\text{Corr}(\mathcal{C})$ is the category of correspondences in \mathcal{C} . A morphism from c_1 to c_2 in $\text{Corr}(\mathcal{C})$ is illustrated, equivalently, by diagrams of the form

$$\begin{array}{ccc} c_1 & \xleftarrow{h} & c \\ & & \downarrow v \\ & & c_2 \end{array} \quad \text{or} \quad \begin{array}{ccc} & c & \\ h \swarrow & & \searrow v \\ c_1 & & c_2 \end{array} \quad \text{or} \quad c_1 \xleftarrow{h} c \xrightarrow{v} c_2.$$

Here, h and v stand for horizontal and vertical respectively. As usual, compositions are given by pullbacks.

More generally, let vert and horiz be two collections of morphisms in \mathcal{C} such that vert (resp. horiz) is closed under pulling back along a morphism in horiz (resp. vert). Then, we let $\text{Corr}(\mathcal{C})_{\text{vert;horiz}}$ be the

⁹ Even though we write Stk , it should be understood as $\text{Stk}_{\mathbb{R}^n}$ when we consider the mixed variant.

1-full subcategory of $\text{Corr}(\mathcal{C})$ consisting of the same objects but for morphisms, we require that $v \in \text{vert}$ and $h \in \text{horiz}$. See [HLa, §4.8.1] for more details.

2.4.7. *The functor B .* When $\mathcal{C} = \text{Spc}_{\text{fin}}$, the category of finite CW-complexes, the functor B ,¹⁰ at the level of objects, is given by

$$B(M) = (\partial M \rightarrow \overline{M}) \in \text{Spc}_{\text{fin}}^{\Delta^1}.$$

Moreover, B sends an open embedding $N \hookrightarrow M$ to the following morphism in $\text{Corr}((\text{Spc}_{\text{fin}}^{\Delta^1})^{\text{op}})$

$$(2.4.8) \quad \begin{array}{ccccc} \partial N & \longrightarrow & \overline{M} \setminus N & \longleftarrow & \partial M \\ \downarrow & & \downarrow & & \downarrow \\ \overline{N} & \longrightarrow & \overline{M} & \xleftarrow{\simeq} & \overline{M}. \end{array}$$

We will often suppress the morphisms and simply use, for example, $(\partial M, \overline{M})$ to denote an object in $\text{Spc}_{\text{fin}}^{\Delta^1}$ to make diagrams and formulas more compact.

2.4.9. *The functor Map .* We have a natural functor

$$\text{Map} : (\text{Spc}^{\Delta^1})^{\text{op}} \rightarrow \text{Stk}$$

which assigns to each object $(N \rightarrow M) \in (\text{Spc}^{\Delta^1})^{\text{op}}$ an object $(BB, BG)^{N, M} := BB^N \times_{BG^N} BG^M$,¹¹ which is precisely the stack of commutative squares

$$\begin{array}{ccc} N & \longrightarrow & BB \\ \downarrow & & \downarrow \\ M & \longrightarrow & BG. \end{array}$$

This functor upgrades naturally to an eponymous functor

$$\text{Map} : \text{Corr}((\text{Spc}^{\Delta^1})^{\text{op}}) \rightarrow \text{Corr}(\text{Stk}),$$

used in (2.4.5) above.

By construction, Map turns colimits in Spc^{Δ^1} to limits in Stk .

2.4.10. *The functor M .* The functor M in (2.4.4) is given by the following result.

Lemma 2.4.11. *The composition $\text{Map} \circ B$ factors through $\text{Corr}(\text{Stk})_{\text{prop;sm}}$, i.e., the horizontal (resp. vertical) maps are smooth (resp. schematic and proper).*

Proof. Let $N \hookrightarrow M$ be a morphism in Mnfd_1 , i.e., it is an open embedding of 1-manifolds. We will now show that the following map

$$(2.4.12) \quad (BB, BG)^{\overline{M} \setminus N, \overline{M}} \simeq BB^{\overline{M} \setminus N} \times_{BG^{\overline{M} \setminus N}} BG^{\overline{M}} \rightarrow BB^{\partial N} \times_{BG^{\partial N}} BG^{\overline{N}} \simeq (BB, BG)^{\partial N, \overline{N}},$$

which is induced by the left square of (2.4.8), is smooth. Since the left square of (2.4.8) is a pushout, we have

$$(BB, BG)^{\overline{M} \setminus N, \overline{M}} \simeq (BB, BG)^{\partial N, \overline{N}} \times_{BB^{\partial N}} BB^{\overline{M} \setminus N}$$

and the map (2.4.12) identifies with the vertical map on the left of the following pullback diagram

$$\begin{array}{ccc} (BB, BG)^{\overline{M} \setminus N, \overline{M}} & \longrightarrow & BB^{\overline{M} \setminus N} \\ \downarrow & & \downarrow \\ (BB, BG)^{\partial N, \overline{N}} & \longrightarrow & BB^{\partial N}. \end{array}$$

It thus suffices to show that the map

$$(2.4.13) \quad BB^{\overline{M} \setminus N} \rightarrow BB^{\partial N}$$

¹⁰ B stands for *boundary*.

¹¹See also Remark 1.4.2 and Footnote 9.

is smooth. Without loss of generality, we can assume that M is connected, in which case, M is either a circle or a line.

When N is empty, it is clear that (2.4.13) is smooth since it is simply

$$BB^{\overline{M}} \rightarrow \text{pt},$$

where $BB^{\overline{M}}$ is either BB or $\frac{B}{B}$ depending on whether M is a line or a circle. Thus, it remains to treat the case where N is non-empty.

When M is a line, the desired statement follows from the fact that (2.4.13) is a product of (copies of) of the smooth maps id_{BB} and $\Delta_{BB} : BB \rightarrow BB \times BB$. When M is a circle, since the only embedding of a circle into itself is a homeomorphism, N can only be a circle or a disjoint union of lines. In the first case, the map under consideration is an equivalence and hence, it is smooth. In the second case, we also see that (2.4.13) is a product of (copies of) the diagonal map $\Delta_{BB} : BB \rightarrow BB \times BB$, which is smooth.

Next, we will show that the following map

$$(2.4.14) \quad (BB, BG)^{\overline{M} \setminus N, \overline{M}} \simeq BB^{\overline{M} \setminus N} \times_{BG^{\overline{M} \setminus N}} BG^{\overline{M}} \rightarrow BB^{\partial M} \times_{BG^{\partial M}} BG^{\overline{M}} \simeq (BB, BG)^{\partial M, \overline{M}},$$

induced by the right square of (2.4.8), is proper. As above, we can (and we will) assume that M is connected. Note that when N is empty, (2.4.14) becomes

$$BB^{\overline{M}} \rightarrow BB^{\partial M} \times_{BG^{\partial M}} BG^{\overline{M}},$$

which is equivalent to

$$\frac{B}{B} \simeq BB^{S^1} \rightarrow \frac{G}{G}$$

when $M \simeq S^1$, and to

$$BB \rightarrow BB \times_{BG} BB$$

when $M \simeq \mathbb{R}$. Both of these are easily seen to be proper.

When N is not empty, then $\overline{M} \setminus N$ and ∂M are homotopically equivalent to a (possibly empty) disjoint union of points. Moreover, $\partial M \rightarrow \overline{M} \setminus N$ is homotopically equivalent to an inclusion of connected components. We will thus treat them as disjoint unions of points in what follows. In particular, we can write $\overline{M} \setminus N \simeq \partial M \sqcup ((\overline{M} \setminus N) \setminus \partial M)$. The map (2.4.14) factors as follows

$$\begin{aligned} BB^{\overline{M} \setminus N} \times_{BG^{\overline{M} \setminus N}} BG^{\overline{M}} &\simeq (BB^{\partial M} \times_{BG^{\partial M}} BG^{\overline{M}}) \times_{BG^{\overline{M}}} (BB^{(\overline{M} \setminus N) \setminus \partial M} \times_{BG^{(\overline{M} \setminus N) \setminus \partial M}} BG^{\overline{M}}) \\ &\rightarrow BB^{\partial M} \times_{BG^{\partial M}} BG^{\overline{M}} \end{aligned}$$

where the last map is induced by $BB^{(\overline{M} \setminus N) \setminus \partial M} \rightarrow BG^{(\overline{M} \setminus N) \setminus \partial M}$ which is proper since it is just a product of maps of the form $BB \rightarrow BG$. The proof thus concludes. \square

2.4.15. *The functor $H_G^{2, \text{ren}}$.* Applying the functor $\text{Shv}_{?, !}^{\text{ren}, *}$ of [HLb, (4.8.13) and Theorem 4.8.20], which is right-lax symmetric monoidal, we complete (2.4.4). Note that in our case, we only need $\text{Shv}_{?, !}^{\text{ren}, *}$ to encode (renormalized) $*$ -pullbacks along smooth morphisms and (renormalized) $!$ -pushforwards along proper morphisms rather than the more general case described in [HLb].

2.4.16. *Renormalized finite Hecke categories.* Being a right-lax symmetric monoidal functor, $H_G^{2, \text{ren}}$ sends algebra objects to algebra objects. In particular,

$$H_G^{2, \text{ren}}(\mathbb{R}) \simeq \text{Shv}_?(BB \times BB) \times_{BG \times BG} BG^{\text{ren}} \simeq \text{Shv}_?(BB \times_{BG} BB)^{\text{ren}}$$

has an algebra structure, induced by the algebra structure on $\mathbb{R} \in \text{Mnfd}_1$, whose multiplication is given by $\mathbb{R}^{\sqcup 2} \hookrightarrow \mathbb{R}$. Chasing through (2.4.8), we see that this is precisely the monoidal structure on $\text{Shv}_?(BB \times_{BG} BB)^{\text{ren}}$ defined earlier via the correspondence (1.4.7). This justifies the abuse of notation where we use $H_G^{2, \text{ren}}$ to denote both the functor and its value on \mathbb{R} .

2.4.17. Horocycle correspondence. We will now explain how the horocycle correspondence appears naturally from this point of view. First, observe that as $\partial S^1 \simeq \emptyset$ and hence, $H_G^{?,\text{ren}}(S^1) \simeq \text{Shv}_?(\frac{G}{G})^{\text{ren}}$ since $BG^{S^1} \simeq \frac{G}{G}$, where the quotient is taken using the conjugation action.

Let $\psi : \mathbb{R} \rightarrow S^1$ be an embedding. The functor B carries ψ to the following diagram

$$\begin{array}{ccccc} \text{pt} \sqcup \text{pt} & \longrightarrow & \text{pt} & \longleftarrow & \emptyset \\ \downarrow & & \downarrow & & \downarrow \\ \mathbb{R} & \longrightarrow & S^1 & \longleftarrow & S^1 \end{array}$$

which is sent to

$$B \backslash G / B \simeq BB \times_{BG} BB \longleftarrow \frac{G}{B} \longrightarrow \frac{G}{G}$$

under $\mathcal{M}\text{ap}$, where we have used $BB \times_{BG} \frac{G}{G} \simeq \frac{G}{B}$. This is the horocycle correspondence appearing in Theorem 1.5.2.

2.5. Augmented cyclic bar construction via Mnfd_1 . Using the geometric picture of §2.4, we will now produce an augmented simplicial object that will be used as the input for Proposition 2.3.3. The underlying simplicial object is the same as the one that computes the categorical trace of $H_G^{?,\text{ren}}$ introduced in (2.1.8).

2.5.1. Circle geometry and augmented simplicial sets. Consider the over-category $(\text{Mnfd}_1)_{/S^1}$. Fix a morphism $\psi : \mathbb{R} \rightarrow S^1$, and consider $(\text{Mnfd}_1)_{\psi//S^1} := ((\text{Mnfd}_1)_{/S^1})_{\psi/}$. We note that $(\text{Mnfd}_1)_{/S^1}$ has a final object, by construction, and moreover, it is precisely the category obtained from $(\text{Disk}_1)_{/S^1} := \text{Disk}_1 \times_{\text{Mnfd}_1} (\text{Mnfd}_1)_{/S^1}$ by adjoining a final object. Similarly, the category $(\text{Mnfd}_1)_{\psi//S^1}$ also has a final object and it is equivalent to the category obtained from $(\text{Disk}_1)_{\psi//S^1}$ by adjoining a final object.

We will now relate $(\text{Mnfd}_1)_{\psi//S^1}$ and Δ_+^{op} using a variation of the construction [Lc, §5.5.3]. Note that an object of $(\text{Mnfd}_1)_{\psi//S^1}$ is given by a diagram

$$\begin{array}{ccc} \mathbb{R} & \xrightarrow{j} & U \\ \searrow \psi & & \swarrow \psi' \\ & S^1 & \end{array}$$

which commutes up to isotopy, where U is either S^1 or a finite disjoint union of copies of \mathbb{R} . The set of components $\pi_0(S^1 \setminus \psi'(U))$ is finite: empty when U is S^1 and equal to the number of components of U when it is a disjoint union of copies of \mathbb{R} . Fix an orientation of the circle. We define a linear ordering \leq on $\pi_0(S^1 \setminus \psi'(U))$: if $x, y \in S^1$ belong to different components of $S^1 \setminus \psi'(U)$, then we write $x < y$ if the three points $(x, y, \psi'(j(0)))$ are arranged in clockwise order around the circle, and $y < x$ otherwise. This construction determines a functor from $(\text{Mnfd}_1)_{\psi//S^1}$ to the opposite of the category of finite linearly ordered sets, which is Δ_+^{op} .

Lemma 2.5.2. *The above construction determines an equivalence of ∞ -categories*

$$\theta_+ : (\text{Mnfd}_1)_{\psi//S^1} \rightarrow \Delta_+^{\text{op}},$$

which restricts to an equivalence of ∞ -categories

$$\theta := \theta_+|_{(\text{Disk}_1)_{\psi//S^1}} : (\text{Disk}_1)_{\psi//S^1} \rightarrow \Delta^{\text{op}}.$$

Proof. The second equivalence is [Lc, Lemma 5.5.3.10]. The first part is a direct extension of the second by adjoining a final object. \square

2.5.3. The augmented simplicial category. We are now ready to construct the augmented simplicial category. Let $\overline{\text{Tr}}(H_G^{?,\text{ren}})_\bullet$ be the augmented simplicial category given by the following composition of functors

$$(2.5.4) \quad \Delta_+^{\text{op}} \xrightarrow{\theta_+^{-1}} (\text{Mnfd}_1)_{\psi//S^1} \xrightarrow{\varphi} \text{Mnfd}_1 \xrightarrow{H_G^{?,\text{ren}}} \text{Shv}_?(pt)\text{-Mod}.$$

Here, φ is the obvious forgetful functor.

Since $BB \times_{BG} BB \simeq B \backslash G/B$ is a finite orbit stack by the Bruhat decomposition, Proposition 2.2.1 implies that $\overline{\text{Tr}}(H_G^{?,\text{ren}})_\bullet|_{\Delta_+^{\text{op}}} \simeq \text{Tr}(H_G^{?,\text{ren}})_\bullet$ of (2.1.8); see also [Lc, Remarks 5.5.3.13 and 5.5.3.14]. In particular,

$$\overline{\text{Tr}}(H_G^{?,\text{ren}})_n \simeq \text{Tr}(H_G^{?,\text{ren}})_n \simeq \text{Shv}_?((BB \times_{BG} BB)^{n+1})^{\text{ren}}, \quad n \geq 0$$

and

$$\overline{\text{Tr}}(H_G^{?,\text{ren}})_{-1} \simeq \text{Shv}_?(\frac{G}{G})^{\text{ren}}$$

where, by convention, $\frac{G}{G}$ denotes the quotient of G by itself under the adjoint action.

2.5.5. “Small” variants. We have the following “small” variants $H_G^?$ and $\overline{\text{Tr}}(H_G^?)_\bullet$ of $H_G^{?,\text{ren}}$ and $\overline{\text{Tr}}(H_G^{?,\text{ren}})_\bullet$, given by the following diagram

$$\begin{array}{ccccccc} \Delta_+^{\text{op}} & \xrightarrow{\theta_+^{-1}} & (\text{Mnfd}_1)_{\psi//S^1} & \xrightarrow{\varphi} & \text{Mnfd}_1 & \xrightarrow{M} & \text{Corr}(\text{Stk})_{\text{prop};\text{sm}} \xrightarrow{\text{Shv}_{?,c,!}^*} \text{Shv}_{?,c}(pt)\text{-Mod}, \\ & & & & & \searrow^{H_G^?} & \\ & & & & & \text{Tr}(H_G^?)_\bullet & \end{array}$$

The only difference between the two versions is that in the last step, we use $\text{Shv}_{?,c,!}^*$ rather than $\text{Shv}_{?,!}^{\text{ren},*}$.

2.6. Adjointability. We are now ready to show that $\overline{\text{Tr}}(H_G^{?,\text{ren}})_\bullet$ satisfies the adjointability condition required by Proposition 2.3.3. The result follows from a simple geometric statement about topological 1-manifolds.

2.6.1. Adjointable squares in a category of correspondences. For any category \mathcal{C} , a commutative square in $\text{Corr}(\mathcal{C})$, which illustrates two morphisms from x to y' to be equivalent, has the following shape

$$(2.6.2) \quad \begin{array}{ccccc} x & \xleftarrow{\quad} & c_{xy} & \xrightarrow{\quad} & y \\ \uparrow & & 2 & \uparrow & 1 \\ c_{xx'} & \xleftarrow{\quad} & c_{xy'} & \xrightarrow{\quad} & c_{yy'} \\ \downarrow & & 3 & \downarrow & 4 \\ x' & \xleftarrow{\quad} & c_{x'y'} & \xrightarrow{\quad} & y' \end{array}$$

where 1 and 3 are pullback squares.

Definition 2.6.3. The commutative diagram in $\text{Corr}(\mathcal{C})$ (2.6.2) is called *adjointable* if 2 and 4 are also pullback squares, i.e., all squares are pullback squares.

2.6.4. Let $\alpha : [n] \rightarrow [m]$ be a morphism in Δ_+ and $M \rightarrow N$ the corresponding morphism in Mnfd_1 via $\varphi \circ \theta_+^{-1}$, see (2.5.4). Let $M_+ \rightarrow N_+$ be the morphism associated to $\alpha_+ : [n+1] \rightarrow [m+1]$. M_+ can be obtained from M by deleting the image of $[-\varepsilon, \varepsilon] \subset \mathbb{R}$ in M for some fixed ε , and similarly for N . This construction is functorial and hence, we obtain the map $M_+ \rightarrow N_+$.

We have the following commutative diagram in Mnfd_1

$$\begin{array}{ccc} M_+ & \longrightarrow & M \\ \downarrow & & \downarrow \\ N_+ & \longrightarrow & N \end{array}$$

which induces, via the B construction of §2.4.7, the following commutative diagram in $\text{Corr}((\text{Spc}_{\text{fin}}^{\Delta^1})^{\text{op}})$

$$(2.6.5) \quad \begin{array}{ccccc} (\partial M_+, \overline{M}_+) & \longrightarrow & (\overline{M} \setminus M_+, \overline{M}) & \longleftarrow & (\partial M, \overline{M}) \\ \downarrow & & \downarrow & & \downarrow \\ (\overline{N}_+ \setminus M_+, \overline{N}_+) & \longrightarrow & (\overline{N} \setminus M_+, \overline{N}) & \longleftarrow & (\overline{N} \setminus M, \overline{N}) \\ \uparrow & & \uparrow & & \uparrow \\ (\partial N_+, \overline{N}_+) & \longrightarrow & (\overline{N} \setminus N_+, \overline{N}) & \longleftarrow & (\partial N, \overline{N}). \end{array}$$

Applying the $\mathcal{M}\text{ap}$ construction, we obtain the following commutative diagram in $\text{Corr}(\text{Stk}_{\mathbb{R}_q})_{\text{prop}; \text{sm}}$

$$(2.6.6) \quad \begin{array}{ccccc} (BB, BG)^{\partial M_+, \overline{M}_+} & \xleftarrow{f} & (BB, BG)^{\overline{M} \setminus M_+, \overline{M}} & \xrightarrow{g} & (BB, BG)^{\partial M, \overline{M}} \\ p \uparrow & 2 & p \uparrow & 1 & p \uparrow \\ (BB, BG)^{\overline{N}_+ \setminus M_+, \overline{N}_+} & \xleftarrow{f} & (BB, BG)^{\overline{N} \setminus M_+, \overline{N}} & \xrightarrow{g} & (BB, BG)^{\overline{N} \setminus M, \overline{N}} \\ q \downarrow & 3 & q \downarrow & 4 & q \downarrow \\ (BB, BG)^{\partial N_+, \overline{N}_+} & \xleftarrow{f} & (BB, BG)^{\overline{N} \setminus N_+, \overline{N}} & \xrightarrow{g} & (BB, BG)^{\partial N, \overline{N}}. \end{array}$$

Lemma 2.6.7. *The diagram (2.6.5) is adjointable in $\text{Corr}((\text{Spc}_{\text{fin}}^{\Delta^1})^{\text{op}})$. As a result, (2.6.6) is adjointable in $\text{Corr}(\text{Stk})_{\text{prop}; \text{sm}}$.*

Proof. The second part follows from the first part because $\mathcal{M}\text{ap}$ turns colimits to limits, and hence, in particular, it sends pushout squares to pullback squares. The first part is an explicit and elementary statement about gluing 1-manifolds that is easier to check directly than to describe. We leave the details to the reader. \square

Proposition 2.6.8. *The augmented simplicial object $\overline{\text{Tr}}(H_G^{?, \text{ren}})_\bullet$ in $\text{Shv}_?(pt)\text{-Mod}$ satisfies the condition of Proposition 2.3.3. Namely, for every $\alpha : [n] \rightarrow [m]$ in Δ_+ , the diagram*

$$(2.6.9) \quad \begin{array}{ccc} \overline{\text{Tr}}(H_G^{?, \text{ren}})_{m+1} & \xrightarrow{d_0} & \overline{\text{Tr}}(H_G^{?, \text{ren}})_m \\ \downarrow & & \downarrow \\ \overline{\text{Tr}}(H_G^{?, \text{ren}})_{n+1} & \xrightarrow{d_0} & \overline{\text{Tr}}(H_G^{?, \text{ren}})_n \end{array}$$

is vertically right adjointable.

Proof. Note that (2.6.9) is obtained from (2.6.6) by applying $\text{Shv}_{?, !}^{*, \text{ren}}$. By Lemma 2.4.11, we know that in (2.6.6), the morphisms f and p (resp. g and q) are smooth (resp. proper). To prove that (2.6.9) is vertically right adjointable, it suffices to show that we have the following natural equivalence

$$g_! f^* p_* q^! \xrightarrow{\simeq} p_* g_! f^*,$$

where we start from the bottom left of (2.6.6). Indeed, we have

$$g_! f^* p_* q^! \simeq g_! p_* f^* q^! \simeq p_* g_! q^! f^* \simeq p_* q^! g_! f^*.$$

where the first, second, and third equivalences are due to the following reasons, respectively

- smooth base change for square 2, using the fact that f is smooth;
- commuting upper $!$ and upper $*$ using the fact that f is smooth, and commuting lower $!$ and lower $*$ using the fact that g is proper; and
- using the fact that g is proper, the desired equivalence follows from $g_* q^! \simeq q^! g_*$, which is the Verdier dual of the usual proper base change result.

\square

Remark 2.6.10. Unlike the “big” version, the “small” variant $\overline{\mathrm{Tr}}(H_G^?)$ discussed in §2.5.5 does not satisfy the adjointability condition of Proposition 2.3.3. This is because the right adjoint to the unit map does not preserve constructibility. Indeed, the right adjoint is given by $g_*f^!$ in the following diagram

$$\begin{array}{ccc} & BB & \\ f \swarrow & & \searrow g \\ BB \times_{BG} BB & & \mathrm{pt}. \end{array}$$

But now, note that g_* does not preserve constructibility.

2.7. Traces and Drinfel’d centers of finite Hecke categories. We are now ready to complete the proof of the first main result. The trace case follows directly from the discussion above and thus will be handled at the beginning of this subsection. We will then deduce the Drinfel’d center case from the trace case.

2.7.1. Traces of finite Hecke categories. We will now prove the trace part of the first main result.

Theorem 2.7.2. *The trace of $H_G^{?,\mathrm{ren}}$ (resp. $H_G^?$) where $H_G^{?,\mathrm{ren}}$ (resp. $H_G^?$) is viewed as an algebra object of $\mathrm{Shv}_?(pt)\text{-Mod}$ (resp. $\mathrm{Shv}_{?,c}(pt)\text{-Mod}$) coincides with the full subcategory of $\mathrm{Shv}_?(\frac{G}{G})^{\mathrm{ren}}$ (resp. $\mathrm{Shv}_{?,c}(\frac{G}{G})$) generated under colimits (resp. finite colimits and idempotent completion) by the image of $H_G^{?,\mathrm{ren}}$ (resp. $H_G^?$) via $q_!p^*$ in the horocycle correspondence¹²*

$$(2.7.3) \quad \begin{array}{ccc} & \frac{G}{B} & \\ p \swarrow & & \searrow q \\ B \backslash G / B & & \frac{G}{G}. \end{array}$$

Moreover, under this identification, the natural functor $\mathrm{tr} : H_G^{?,\mathrm{ren}} \rightarrow \mathrm{Tr}(H_G^{?,\mathrm{ren}})$ (resp. $\mathrm{tr} : H_G^? \rightarrow \mathrm{Tr}(H_G^?)$) is identified with $q_!p^*$.

Proof. We start with the “big” variant $H_G^{?,\mathrm{ren}}$. Propositions 2.3.3 and 2.6.8 imply that the natural functor $\mathrm{Tr}(H_G^{?,\mathrm{ren}}) \rightarrow \mathrm{Shv}_?(\frac{G}{G})^{\mathrm{ren}}$ is fully faithful. Moreover, the functor $H_G^{?,\mathrm{ren}} \rightarrow \mathrm{Tr}(H_G^{?,\mathrm{ren}}) \hookrightarrow \mathrm{Shv}_?(\frac{G}{G})^{\mathrm{ren}}$ identifies with $q_!p^*$ in the horocycle correspondence.

By [GR, Volume I, Chapter 1, Proposition 8.7.4], we know that $\mathrm{Tr}(H_G^{?,\mathrm{ren}})$ is compactly generated by the essential image of $H_G^? \rightarrow H_G^{?,\mathrm{ren}} \rightarrow \mathrm{Tr}(H_G^{?,\mathrm{ren}})$. Note that the conditions required to apply this result amount to the existence of the “small” variant introduced in §2.5.5.

Combining the two statements, we conclude that $\mathrm{Tr}(H_G^{?,\mathrm{ren}})$ is identified with the full subcategory of $\mathrm{Shv}_?(\frac{G}{G})^{\mathrm{ren}}$ compactly generated by the image of $H_G^? = \mathrm{Shv}_{?,c}(B \backslash G / B)$ under the horocycle correspondence. In particular, it is generated by the image of $H_G^{?,\mathrm{ren}}$ under colimits.

The “small” variant is obtained from the first by taking the full subcategories of compact objects, using Proposition 2.1.2. The statement regarding generation under finite colimits and idempotent splittings follows from [GR, Volume I, chapter 1, Lemma 7.2.4.(1)]. \square

2.7.4. Drinfel’d centers of the finite Hecke categories. The case of Drinfel’d center is slightly more subtle. Consider the following versions $H_G^{?,\mathrm{ren},!}$ (resp. $H_G^{?,!}$) of the Hecke categories where instead of using $\mathrm{Shv}_{?,!}^{\mathrm{ren},*}$ (resp. $\mathrm{Shv}_{?,c,!}^*$), we use $\mathrm{Shv}_{?,*}^{\mathrm{ren},!}$ (resp. $\mathrm{Shv}_{?,c,*}^!$). More concretely, we use $g_*f^!$ in the correspondence (1.4.7) to define the convolution monoidal structure.

Since f is smooth of relative dimension $\dim B$, $f^! \simeq f^*[2\dim B](\dim B)$ in the mixed case and $f^! \simeq f^*[2\dim B]\langle 2\dim B \rangle$ in the graded case, where $(-)$ denotes the Tate twist and $\langle - \rangle$ denote the grading shift defined in [HLb, §4.4.7].¹³ Note that in the ungraded setting, we simply have $f^! \simeq f^*[2\dim B]$. Thus, by cohomologically shifting and Tate twisting $[-2\dim B](\dim B)$ for the mixed case (resp. cohomologically shifting and grade shifting $[-2\dim B]\langle -2\dim B \rangle$ for the graded case, rep.

¹²See Remark 1.4.2.

¹³The factor 2 is there because weight is twice the Tate twist.

cohomologically shifting $[-2\dim B]$ for the ungraded case), we obtain an equivalence of monoidal categories

$$H_G^{?,\text{ren}} \xrightarrow{\simeq} H_G^{?,\text{ren},!} \quad \text{and} \quad H_G^{?} \xrightarrow{\simeq} H_G^{?,!}$$

Even though the $!$ -version is equivalent to the usual version, it is, as we shall see, technically more advantageous to use when studying the center.

2.7.5. Observe that the category $H^{?,\text{ren},!}$ is self-dual as an object in $\text{Shv}_?(pt)\text{-Mod}$. Indeed, first note that any object $\mathcal{Y} \in \text{Corr}(\text{Stk})$ is self-dual, with duality datum given by

$$pt \leftarrow \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y} \quad \text{and} \quad \mathcal{Y} \times \mathcal{Y} \leftarrow \mathcal{Y} \rightarrow pt.$$

Thus, if \mathcal{Y} is a finite orbit stack, such as $\mathcal{Y} = BB \times_{BG} BB$, $\text{Shv}_{?,*}^{\text{ren},!}$ turns the self-duality datum above into a self-duality datum of $\text{Shv}_?(X)^{\text{ren}}$, using Proposition 2.2.1. In particular, $H^{?,\text{ren},!}$ is self dualizable.

Suppose

$$\mathcal{X} \leftarrow \mathcal{Z} \rightarrow \mathcal{Y}$$

is a morphism from \mathcal{X} to \mathcal{Y} in $\text{Corr}(\text{Stk})$. The dual of this morphism is precisely

$$\mathcal{Y} \leftarrow \mathcal{Z} \rightarrow \mathcal{X}.$$

Thus, if \mathcal{X} and \mathcal{Y} are finite orbit stacks, then the functors $\text{Shv}_?(\mathcal{X})^{\text{ren}} \rightarrow \text{Shv}_?(\mathcal{Y})^{\text{ren}}$ and $\text{Shv}_?(\mathcal{Y})^{\text{ren}} \rightarrow \text{Shv}_?(\mathcal{X})^{\text{ren}}$ associated to the two correspondences above are dual to each other. Note that when following the correspondences here, we use $(-)_*(-)^!$.

2.7.6. We are now ready to compute the Drinfel'd centers of $H_G^{?,\text{ren}}$.

Theorem 2.7.7. *The Drinfel'd center $Z(H_G^{?,\text{ren}})$ of $H_G^{?,\text{ren}}$, where the latter is viewed as an object in the category $\text{Alg}(\text{Shv}_?(pt)\text{-Mod})$, coincides with its trace $\text{Tr}(H_G^{?,\text{ren}})$. Moreover, under the identification of $\text{Tr}(H_G^{?,\text{ren}})$ as a full subcategory of $\text{Shv}_?(\frac{G}{G})^{\text{ren}}$, the natural functor $z : Z(H_G^{?,\text{ren}}) \rightarrow H_G^{?,\text{ren}}$ can be identified with $p_*q^!$ in the horocycle correspondence (2.7.3). In particular, we have a pair of adjoint functor $\text{tr} \dashv z$.*

Proof. To simplify the notation, we will write $\mathcal{A} = H_G^{?,\text{ren},!}$ and $\mathcal{B} = H^{?,\text{ren}}$. Moreover, unless otherwise specified, all tensors and $\mathcal{H}\text{om}$ are over $\text{Shv}_?(pt)$. We will therefore omit $\text{Shv}_?(pt)$ from the notation.

Recalling from Definition 1.4.5, we have

$$Z(\mathcal{A}) \simeq \underline{\mathcal{H}\text{om}}_{\mathcal{A} \otimes \mathcal{A}^{\text{rev}}}(\mathcal{A}, \mathcal{A}),$$

i.e., the category of continuous $\mathcal{A} \otimes \mathcal{A}^{\text{rev}}$ -linear functors from \mathcal{A} to itself. As in [BFN, §5.1.1], we have an equivalence of categories $\mathcal{A} \simeq |\mathcal{A}^{\otimes(\bullet+2)}|$. Thus,

$$\begin{aligned} & \underline{\mathcal{H}\text{om}}_{\mathcal{A} \otimes \mathcal{A}^{\text{rev}}}(\mathcal{A}, \mathcal{A}) \\ & \simeq \underline{\mathcal{H}\text{om}}_{\mathcal{A} \otimes \mathcal{A}^{\text{rev}}}(|\mathcal{A}^{\otimes(\bullet+2)}|) \\ & \simeq \text{Tot}(\underline{\mathcal{H}\text{om}}_{\mathcal{A} \otimes \mathcal{A}^{\text{rev}}}(\mathcal{A}^{\otimes(\bullet+2)}, \mathcal{A})) \\ & \simeq \text{Tot}(\underline{\mathcal{H}\text{om}}(\mathcal{A}^{\otimes\bullet}, \mathcal{A})) \\ (2.7.8) \quad & \simeq \text{Tot}(\mathcal{A}^{\otimes(\bullet+1)}) \end{aligned}$$

$$\begin{aligned} (2.7.9) \quad & \simeq |\mathcal{B}^{\otimes(\bullet+1)}| \\ & \simeq \text{Tr}(\mathcal{B}). \end{aligned}$$

Here, (2.7.8) is obtained by passing to the duals, using the discussion in §2.7.5. Moreover, (2.7.9) is obtained by passing to left adjoints, see [Ld, Corollary 5.5.3.4] (see also [GR, Volume I, Chapter 1, Proposition 2.5.7]), and noticing that the resulting diagram is precisely the diagram used to compute the trace of $\mathcal{B} := H_G^{?,\text{ren}}$. We deduce the corresponding statement for $Z(\mathcal{B})$ using the equivalence of monoidal categories $\mathcal{A} \simeq \mathcal{B}$.

The second part regarding the identification of the functor z follows from the argument above. \square

2.7.10. We will now study the centers of the “small” version $H_G^?$, which is more subtle than the case of traces above.

Theorem 2.7.11. *The Drinfel’d center $Z(H_G^?)$ of $H_G^? \in \text{Alg}(\text{Shv}_{?,c}(\text{pt})\text{-Mod})$ is equivalent to the full subcategory of $Z(H_G^{?,\text{ren}})$ consisting of objects whose images under the natural central functor z are constructible as sheaves on $B \backslash G/B$.*

Proof. For brevity’s sake, we write $\mathcal{A} = H_G^{?,\text{ren},!}$ and $\mathcal{A}_0 = H_G^{?,!}$. Moreover, as all tensors and $\mathcal{H}\text{om}$, unless otherwise specified, will be over $\text{Shv}_?(pt)$ or $\text{Shv}_{?,c}(pt)$ depending on whether we are working with “big” or “small” categories, which should be clear from the context. We will thus not include $\text{Shv}_?(pt)$ or $\text{Shv}_{?,c}(pt)$ in the notation.

By definition,

$$Z(\mathcal{A}_0) \simeq \mathcal{H}\text{om}_{\mathcal{A}_0 \otimes \mathcal{A}_0^{\text{rev}}}(\mathcal{A}_0, \mathcal{A}_0),$$

the category of exact $\mathcal{A}_0 \otimes \mathcal{A}_0^{\text{rev}}$ -linear functors from \mathcal{A}_0 to itself. As in the proof of Theorem 2.7.7, we have

$$Z(\mathcal{A}_0) \simeq \text{Tot}(\mathcal{H}\text{om}(\mathcal{A}_0^{\otimes \bullet}, \mathcal{A}_0)),$$

which naturally embeds into

$$Z(\mathcal{A}) \simeq \text{Tot}(\mathcal{H}\text{om}(\mathcal{A}^{\otimes \bullet}, \mathcal{A}))$$

whose essential image is the the full subcategory of $Z(\mathcal{A})$ consisting of objects whose images in $\mathcal{H}\text{om}(\mathcal{A}^{\otimes \bullet}, \mathcal{A})$ are compact preserving functors. Observe that all the functors between $\mathcal{A}^{\otimes \bullet}$ (which induces functors between $\text{Tot}(\mathcal{H}\text{om}(\mathcal{A}^{\otimes \bullet}, \mathcal{A}))$) are compact preserving since we only push along schematic (in fact proper) morphisms, by Lemma 2.4.11. Thus, $Z(\mathcal{A}_0)$ is, equivalently, the full subcategory of $Z(\mathcal{A})$ spanned by objects whose images in

$$\mathcal{H}\text{om}(\mathcal{A}^{\otimes 0}, \mathcal{A}) \simeq \mathcal{H}\text{om}(\text{Shv}_?(pt), \mathcal{A}) \simeq \mathcal{A} \simeq \text{Shv}_{gr}(B \backslash G/B)^{\text{ren}}$$

are compact, i.e., constructible. But this functor is precisely the central functor z and is identified with $p_*q^!$ in the horocycle correspondence (2.7.3) as in the proof of Theorem 2.7.7 above.

The statement for $H_G^?$ follows since $H_G^? \simeq H_G^{?,!}$ and the proof concludes. \square

2.8. Character sheaves. We will now state our results in terms of character sheaves. We start with the following definition.

Definition 2.8.1. The *renormalized category of mixed (resp. graded, resp. ungraded) unipotent character sheaves* of G , denoted by $\text{Ch}_G^{u,?,\text{ren}}$ where $? = m$ (resp. $? = gr$, resp. $? = \emptyset$), is the full subcategory of $\text{Shv}_?(\frac{G}{G})^{\text{ren}}$ generated by colimits by the image of $H_G^{?,\text{ren}}$ under $q_!p^*$ in the horocycle correspondence (2.7.3). Equivalently, it is compactly generated by the image of $H_G^?$ under this functor.

The *category of mixed (resp. graded, resp. ungraded) unipotent character sheaves* of G is the full subcategory spanned by compact objects, i.e.,

$$\text{Ch}_G^{u,?} := (\text{Ch}_G^{u,?,\text{ren}})^c = \text{Ch}_G^{u,?,\text{ren}} \cap \text{Shv}_{?,c}\left(\frac{G}{G}\right).$$

Finally, the *category of mixed (resp. graded, resp. ungraded) monodromic character sheaves*, denoted by $\widetilde{\text{Ch}}_G^{u,?}$, is the full subcategory of $\text{Ch}_G^{u,?,\text{ren}}$ consisting of objects whose images under $p_*q^!$ are constructible, where p and q are defined in the horocycle correspondence (2.7.3).

Remark 2.8.2. The last equality in the definition of $\text{Ch}_G^{u,?}$ uses the following fact: if we have a fully faithful and compact preserving functor $A \hookrightarrow B$, then $A^c = A \cap B^c$. Indeed, we have $A^c \subseteq A \cap B^c$ due to the compact preservation assumption. On the other hand, $A \cap B^c \subseteq A^c$ is always true by the very definition of compactness. In the case of interest, the fact that the functor involved is compact preserving is proved in Theorem 2.7.2 above.

With the new notation, Theorems 2.7.2, 2.7.7, and 2.7.11 above can be summarized in the following theorem.

Theorem 2.8.3. *The trace $\mathrm{Tr}(H_G^{?,\mathrm{ren}})$ and center $Z(H_G^{?,\mathrm{ren}})$ of $H_G^{?,\mathrm{ren}}$ coincide with the full subcategory $\mathrm{Ch}_G^{u,?,\mathrm{ren}}$ of $\mathrm{Shv}_{?,\left(\frac{G}{G}\right)^{\mathrm{ren}}}$ generated under colimits by the essential image of $H_G^{?,\mathrm{ren}}$ under $q_!p^*$ in the correspondence*

$$\begin{array}{ccc} & \frac{G}{B} & \\ p \swarrow & & \searrow q \\ B \backslash G/B & & \frac{G}{G}. \end{array}$$

Moreover, under this identification, the canonical trace and center maps are adjoint $\mathrm{tr} \dashv z$ and are identified with the adjoint pair $q_!p^* \dashv p_*q^!$.

The trace $\mathrm{Tr}(H_G^?)$ coincides with the full subcategory $\mathrm{Ch}_G^{u,?}$ of $\mathrm{Ch}_G^{u,?,\mathrm{ren}}$ spanned by compact objects. Moreover, the center $Z(H_G^?)$ is the full subcategory $\widetilde{\mathrm{Ch}}_G^{u,?}$ of $\mathrm{Ch}_G^{u,?,\mathrm{ren}}$ spanned by the pre-image of $H_G^?$ under the central functor z .

Remark 2.8.4. It is easy to see that $\mathrm{Ch}_G^{u,\mathrm{gr}}$ is contained in $\widetilde{\mathrm{Ch}}_G^{u,\mathrm{gr}}$. In fact, the latter is strictly larger, already when $G = \mathbb{G}_m$, the multiplicative group. Indeed, in this case, $H_{\mathbb{G}_m}^{\mathrm{gr},\mathrm{ren}} \simeq \mathrm{Shv}_{\mathrm{gr}}(B\mathbb{G}_m)^{\mathrm{ren}}$ and $\mathrm{Ch}_{\mathbb{G}_m}^{u,\mathrm{gr},\mathrm{ren}}$ is the full subcategory of $\mathrm{Shv}_{\mathrm{gr}}\left(\frac{\mathbb{G}_m}{\mathbb{G}_m}\right)^{\mathrm{ren}} \simeq \mathrm{Shv}_{\mathrm{gr}}(\mathbb{G}_m \times B\mathbb{G}_m)^{\mathrm{ren}}$ generated by the constant sheaf. Moreover, the natural central functor is simply given by p_* where $p : \mathbb{G}_m \times B\mathbb{G}_m \rightarrow B\mathbb{G}_m$ is the projection onto the second factor. Thus, to see that $\widetilde{\mathrm{Ch}}_G^{u,\mathrm{gr}}$ is larger than $\mathrm{Ch}_G^{u,\mathrm{gr}}$, it suffices to realize that $\pi_* : \mathrm{LS}_{\mathrm{gr}}^u(\mathbb{G}_m) \rightarrow \mathrm{Vect}^{\mathrm{gr}}$ does not reflect constructibility, where $\mathrm{LS}_{\mathrm{gr}}^u(\mathbb{G}_m)$ is the full subcategory of $\mathrm{Shv}_{\mathrm{gr}}(\mathbb{G}_m)$ consisting of unipotent local systems, i.e., it is generated by (grading shifts of) the constant sheaves, and where $\pi : \mathbb{G}_m \rightarrow \mathrm{pt}$ is the structure morphism.

By construction,¹⁴

$$\mathrm{LS}_{\mathrm{gr}}^u(\mathbb{G}_m) \xrightarrow[\simeq]{\mathcal{H}\mathrm{om}^{\mathrm{gr}}(\overline{\mathbb{Q}}_\ell, -) \simeq \pi_*} \mathcal{E}\mathrm{nd}^{\mathrm{gr}}(\overline{\mathbb{Q}}_\ell)^{\mathrm{op}}\text{-}\mathrm{Mod}(\mathrm{Vect}^{\mathrm{gr}}) \simeq \overline{\mathbb{Q}}_\ell[\alpha]\text{-}\mathrm{Mod}(\mathrm{Vect}^{\mathrm{gr}}),$$

where $\alpha^2 = 0$ and α lives in cohomological degree 1 and graded degree 2. Under this equivalence, π_* corresponds to the forgetful functor $\overline{\mathbb{Q}}_\ell[\alpha]\text{-}\mathrm{Mod}(\mathrm{Vect}^{\mathrm{gr}}) \rightarrow \mathrm{Vect}^{\mathrm{gr}} \simeq \mathrm{Shv}_{\mathrm{gr}}(\mathrm{pt})$. But now, on the one hand, the object $\overline{\mathbb{Q}}_\ell \in \overline{\mathbb{Q}}_\ell[\alpha]\text{-}\mathrm{Mod}(\mathrm{Vect}^{\mathrm{gr}})$ is not compact and hence, it corresponds to a non-constructible sheaf on the left. On the other hand, its image in $\mathrm{Vect}^{\mathrm{gr}}$ is compact.

Remark 2.8.5. The restriction of the adjunction $\mathrm{tr} : H_G^{?,\mathrm{ren}} \rightleftarrows \mathrm{Ch}_G^{u,?,\mathrm{ren}} : z$ to small categories yields the following commutative diagram

$$\begin{array}{ccc} & \mathrm{Ch}_G^{u,?} & \\ \mathrm{tr} \nearrow & \downarrow \iota & \\ H_G^? & \xrightarrow[\bar{z}]{\mathrm{tr}} & \widetilde{\mathrm{Ch}}_G^{u,?} \end{array}$$

where $\bar{\mathrm{tr}} \simeq \iota \circ \mathrm{tr}$ and $\bar{z} \simeq z \circ \iota$.

2.9. Weight structure and perverse t -structure on $\mathrm{Ch}_G^{u,\mathrm{gr}}$. In this subsection, we will show that $\mathrm{Ch}_G^{u,\mathrm{gr}}$ inherits the weight structure and perverse t -structure from the ambient category $\mathrm{Shv}_{\mathrm{gr},c}(G/G)$.

2.9.1. The perverse t -structure on $\mathrm{Ch}_G^{u,?}$. We will now show that for $? \in \{\mathrm{gr}, \emptyset\}$, the category $\mathrm{Ch}_G^{u,?}$ inherits the perverse t -structure from $\mathrm{Shv}_{?,c}(G/G)$. Moreover, $\mathrm{Ch}_G^{u,\mathrm{gr}}$ inherits the weight structure from $\mathrm{Shv}_{\mathrm{gr},c}(G/G)$.

We start with a general lemma concerning t -structures.

Lemma 2.9.2. *Let \mathcal{D} be a triangulated category equipped with a bounded t -structure whose heart is Artinian. Let $\mathcal{C} := \langle \mathcal{L}_i \rangle_{i \in I}$ be the smallest full DG-subcategory of \mathcal{D} containing a collection of simple objects $\{\mathcal{L}_i\}_{i \in I}$ for some indexing set I . Then \mathcal{C} is stable under the truncation of \mathcal{D} and hence, it inherits the t -structure on \mathcal{D} . Consequently, \mathcal{C} is idempotent complete.*

¹⁴The superscript gr in $\mathcal{H}\mathrm{om}^{\mathrm{gr}}$ and $\mathcal{E}\mathrm{nd}^{\mathrm{gr}}$ denotes the $\mathrm{Vect}^{\mathrm{gr}}$ -enriched Hom-spaces. See [HLb, §3.2.6].

Proof. The argument is similar to that of [HLb, Proposition 5.6.2]. For $\mathcal{F} \in \text{Shv}_{\gamma,c}(\mathcal{Y})$, we will show that the following conditions are equivalent

- (i) $\mathcal{F} \in \mathcal{C}$;
- (ii) the simple constituents of $H^i(\mathcal{F})$ belongs to $\{\mathcal{L}_i\}_{i \in I}$.

Indeed, suppose \mathcal{F} satisfies (ii), then \mathcal{F} can be built from successive extensions of \mathcal{L}_i 's, which then implies that $\mathcal{F} \in \mathcal{C}$, i.e., \mathcal{F} satisfies (i). The other direction is obtained by observing that (ii) is closed under finite direct sums, shifts, and cones.

Condition (ii) is clearly stable under the perverse truncations of $\text{Shv}_{\gamma,c}(\mathcal{Y})$ and hence, \mathcal{C} inherits the perverse t -structure of $\text{Shv}_{\gamma,c}(\mathcal{Y})$. Since this t -structure is bounded, idempotent completeness of \mathcal{C} follows from [AGH, Corollary 2.14]. \square

Corollary 2.9.3. *For $? \in \{\text{gr}, \emptyset\}$, that is, we are working in the graded or ungraded setting, the category $\text{Ch}_G^{u,?}$ is stable under the perverse truncations of $\text{Shv}_{\gamma,c}(G/G)$, and hence, it inherits the perverse t -structure on $\text{Shv}_{\gamma,c}(G/G)$.*

Proof. We will argue for the graded case as the ungraded case is identical and is in fact well-known.

By definition, $\text{Ch}_G^{u,\text{gr}}$ is the smallest idempotent complete full DG-subcategory of $\text{Shv}_{\text{gr},c}(G/G)$ containing the images $\text{tr}(\mathcal{K})$ of $\mathcal{K} \in H_G^{\text{gr}}$ that are irreducible perverse sheaves, i.e., they are (grading shifts of) Kazhdan–Lusztig elements. Since tr is obtained by pulling back along a smooth map and pushing forward along a proper map, $\text{tr}(\mathcal{K})$ decomposes into a finite direct sum of simple perverse sheaves.¹⁵ Let \mathcal{C} be the smallest full DG-subcategory containing these simple perverse sheaves. By Lemma 2.9.2, \mathcal{C} inherits the perverse t -structure on $\text{Shv}_{\text{gr},c}(G/G)$. It remains to show that $\mathcal{C} = \text{Ch}_G^{u,\text{gr}}$.

Clearly, $\mathcal{C} \subseteq \text{Ch}_G^{u,\text{gr}}$. Moreover, $\text{Ch}_G^{u,\text{gr}}$ is the idempotent completion of \mathcal{C} . But by Lemma 2.9.2, \mathcal{C} is already idempotent complete. Thus, we are done. \square

2.9.4. *Weight structure on $\text{Ch}_G^{u,\text{gr}}$.* We will now turn to the weight structure.

Lemma 2.9.5. *The category $\text{Ch}_G^{u,\text{gr}}$ inherits the weight structure on $\text{Shv}_{\text{gr},c}(G/G)$. Consequently, the trace functor $\text{tr} : H_G^{\text{gr}} \rightarrow \text{Ch}_G^{u,\text{gr}}$ is weight exact.*

Proof. As above, $\text{Ch}_G^{u,\text{gr}}$ is generated as a DG-category by $\text{tr}(\mathcal{K})$ where $\mathcal{K} \in H_G^{\text{gr}}$ is pure of weight 0. Note that $\text{tr}(\mathcal{K})$ is pure of weight 0 in $\text{Shv}_{\text{gr},c}(G/G)$ since in the horocycle correspondence, we only pull back along a smooth map and push forward along a proper map. Thus, the objects $\text{tr}(\mathcal{K})$ form a negatively self-orthogonal collection in $\text{Shv}_{\text{gr},c}(G/G)$, and hence, also in $\text{Ch}_G^{u,\text{gr}}$. By [BS, Corollary 2.1.2] (see also [ESb, Remark 2.2.6]), they form the weight heart of a weight structure on $\text{Ch}_G^{u,\text{gr}}$. It is clear from the definition of this weight structure that it is compatible with the one on $\text{Shv}_{\text{gr},c}(G/G)$. \square

2.10. Rigidity and consequences. In this subsection, we show that the finite Hecke categories are (compactly generated) rigid monoidal categories from which we deduce various interesting consequences. This subsection is mostly independent from the rest of the paper.

2.10.1. *Rigidity of finite Hecke categories.* The rigidity of Hecke categories has been established in [BN].

Proposition 2.10.2 ([BN, Theorem 6.2]). *The category $H_G^{?,\text{ren}}$ is compactly generated rigid monoidal.*

Proof. $H_G^{?,\text{ren}}$ is compactly generated by construction. Rigidity follows from the same proof as that of [BN, Theorem 6.2]. Indeed, the same argument as over there implies that $H_G^{?,\text{ren}}$ is semi-rigid. But since we are working with the renormalized category of sheaves, all constructible sheaves are compact by definition. In particular, the monoidal unit is compact. Thus, they are rigid, see [BN, Proposition 3.3]. \square

Remark 2.10.3. As a consequence of Proposition 2.10.2, $H_G^?$ is rigid as “small” monoidal categories in the sense of Remark 2.1.4.

¹⁵Note that this is not necessarily the case if we work with the mixed sheaves, i.e., when $? = m$.

2.10.4. *Rigidity of Drinfel'd centers.* The rigidity of finite Hecke categories implies that for their Drinfel'd centers.

Proposition 2.10.5. *The (braided) monoidal category $Z(H_G^{?,\text{ren}})$ is semi-rigid. Moreover, the (braided) monoidal category $Z(H_G^?)$ is rigid (in the sense of Remark 2.1.4).*

Proof. The “small” case follows from [KZ, Remark 2.4.2]. For the “big” case, first note that by construction, we have a (braided) monoidal functor $Z(H_G^?) \hookrightarrow Z(H_G^{?,\text{ren}})$ whose image contains the compact generators of $Z(H_G^{?,\text{ren}})$, see also Remark 2.8.4. But since all objects of $Z(H_G^?)$ are dualizable (as the category is rigid), the compact generators of $Z(H_G^{?,\text{ren}})$ are also dualizable. In other words, $Z(H_G^{?,\text{ren}})$ is compactly generated by dualizable objects, and hence, is semi-rigid by definition, see [BN, Definition 3.1]. \square

Directly from the Definition 1.4.5, we see that the Drinfel'd center always acts on the original category and its trace. We will use \otimes to denote this action. In the case of Hecke categories, we have the following compatibility.

Corollary 2.10.6. *Using the same notation as in Remark 2.8.5, let $a \in H_G^{?,\text{ren}}$ (resp. $a \in H_G^?$) and $b \in \text{Ch}_G^{u,?,\text{ren}}$ (resp. $b \in \widetilde{\text{Ch}}_G^{u,?}$). Then, we have a natural equivalence*

$$\begin{aligned} \text{tr}(a \otimes z(b)) &\simeq \text{tr}(a) \otimes b \\ (\text{resp. } \quad \widetilde{\text{tr}}(a \otimes z(b)) &\simeq \widetilde{\text{tr}}(a) \otimes b). \end{aligned}$$

Proof. The statement is equivalent to stating that the functor tr (resp. $\widetilde{\text{tr}}$) is a functor of $\text{Ch}_G^{u,?,\text{ren}}$ - (resp. $\widetilde{\text{Ch}}_G^{u,?}$)-modules. By [BN, Lemma 3.5] (resp. [KZ, Remark 2.4.2]), this follows from the fact that the central functor z is monoidal and that $\text{Ch}_G^{u,\text{ren}}$ (resp. Ch_G^u) is semi-rigid (resp. rigid). \square

2.10.7. *Hochschild homology.* Let c be a dualizable object, with dual c^\vee , in a symmetric monoidal category \mathcal{C} , see [GR, Volume I, Chapter 1, §4].¹⁶ Then, the trace of c , also known as the *Hochschild homology* of c and denoted by $\text{HH}(c)$,¹⁷ is an element of $\text{End}_{\mathcal{C}}(1_{\mathcal{C}})$, where $1_{\mathcal{C}}$ is the monoidal unit of \mathcal{C} , given by the following composition

$$1_{\mathcal{C}} \xrightarrow{\text{coev}_c} c \otimes c^\vee \simeq c^\vee \otimes c \xrightarrow{\text{ev}_c} 1_{\mathcal{C}},$$

where coev_c and ev_c are, respectively, the co-evaluation and evaluation maps coming from the duality datum between c and c^\vee .

The category \mathcal{C} of interest to us is $\text{Shv}_?(pt)\text{-Mod}$. Since $\text{Shv}_?(pt)$ is a rigid symmetric monoidal category, [GR, Volume I, Chapter 1, Propositions 7.3.2 & 9.4.4] imply that any compactly generated category in $\text{Shv}_?(pt)\text{-Mod}$ is dualizable. Given such an object \mathcal{A} in $\text{Shv}_?(pt)\text{-Mod}$, its Hochschild homology $\text{HH}(\mathcal{A})$ is an object in $\text{Shv}_?(pt)$.

When $\mathcal{A} \in \text{Alg}(\text{Shv}_?(pt)\text{-Mod})$, such that the underlying object $\mathcal{A} \in \text{Shv}_?(pt)\text{-Mod}$ is dualizable, $\text{HH}(\mathcal{A})$ acquires a natural algebra structure, i.e., $\text{HH}(\mathcal{A}) \in \text{Alg}(\text{Shv}_?(pt))$, see [G+, §3.3.2].

2.10.8. We have the following result from [G+, Theorem 3.8.5]. Note that the meanings of HH and Tr in that paper are switched compared to ours. Note also that they prove it for the case where the ambient category is $\text{DGCat}_{\text{pres,cont}}$. However, the same proof carries through for $\text{Shv}_?(pt)\text{-Mod}$.

Theorem 2.10.9 ([G+, Theorem 3.8.5]). *Let \mathcal{A} be a rigid monoidal category in $\text{Shv}_?(pt)\text{-Mod}$ such that \mathcal{A} is dualizable. Then, there is a canonical equivalence of associative algebras*

$$\text{HH}(\mathcal{A}) \simeq \text{End}_{\text{Tr}(\mathcal{A})}^?(\text{tr}(1_{\mathcal{A}})) \in \text{Alg}(\text{Shv}_?(pt)),$$

where the superscript $?$ in End , which is a place holder for m (resp. gr , resp. $nothing/\emptyset$), denotes the $\text{Shv}_m(pt_n)$ - (resp. Vect^{gr} , resp. Vect)-enriched Hom-spaces. See [HLb, §3.2.6].

¹⁶Note that since we are working in a symmetric monoidal category, the left and right duals coincide.

¹⁷This is not to be confused with the notion of trace used above. Because of this reason, why we will exclusively use the term Hochschild homology for the type of trace discussed here.

2.10.10. Let $\text{Spr}_G^? = \text{tr}(1_{H_G^?}) \in \text{Ch}_G^{u,?}$ denote the image of the monoidal unit of the finite Hecke category via the natural functor. In the ungraded setting, this is known as the *Grothendieck–Springer sheaf*. In the mixed (resp. graded) case, we will thus refer to this object as the *mixed (resp. graded) Grothendieck–Springer sheaf*. Proposition 2.10.2 and Theorem 2.10.9 implies the following result.

Theorem 2.10.11. *We have natural an equivalence of algebras*

$$\text{HH}(H_G^{?,\text{ren}}) \simeq \text{End}^?(\text{Spr}_G^?) \in \text{Alg}(\text{Shv}_?(pt)).$$

3. FORMALITY OF THE GROTHENDIECK–SPRINGER SHEAF

The first main result of this section, Theorem 3.2.1, states that $\text{End}^{\text{gr}}(\text{Spr}_G^{\text{gr}}) \in \text{Alg}(\text{Shv}_{\text{gr}}(pt)) \simeq \text{Alg}(\text{Vect}^{\text{gr}})$ is formal. It is obtained by a spreading argument, taking, as input, the ungraded case, proved by the second-named author using transcendental methods. Combining with a generation result of Lusztig in type A, the formality result provides a concrete realization of the category of graded unipotent character sheaves, Theorem 3.3.4.

Below, the ungraded case is recalled in §3.1, followed by the proof of the graded case in §3.2 using a spreading argument. The section then concludes with §3.3, where everything can be made more explicit, especially in type A.

3.1. The ungraded case via transcendental method. In this subsection, we will work over \mathbb{C} ; namely, the geometric objects are stacks over \mathbb{C} and the sheaves are in \mathbb{C} -vector spaces. Denote $p : B/B \rightarrow G/G$, and $q : B/B \rightarrow T/T$. Put $\text{Ind}_{T \subset B}^G := p_! q^*$ and its right adjoint $\text{Res}_{T \subset B}^G := q_* p^!$. We have $\text{Spr}_G = p_! \mathbb{C}_{B/B} = \text{Ind}_{T \subset B}^G \mathbb{C}_{T/T} \in \text{Ch}_G^u$. Here, all the quotients are obtained by using the adjoint actions.

The category of all character sheaves Ch_G was explicitly computed in [La] (for simply connected groups) and [Lb] (for reductive groups) by using a complex analytic cover of the adjoint quotient G/G to reduce the calculation to generalized Springer theory. We need the following particular statement.

Theorem 3.1.1 ([Lb]). *Let G be a reductive group.*

(i) *There is an equivalence of DG-algebras*

$$\text{End}(\text{Spr}_G) \simeq (H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W].$$

In particular, $\text{End}(\text{Spr}_G)$ is a formal DG-algebra.

(ii) *There is a natural equivalence $\text{Res}_{T \subset B}^G(\text{Spr}_G) \simeq \mathbb{C}_{T/T}^{\oplus W}$. Moreover, the natural DG-algebra homomorphism $\text{End}(\text{Spr}_G) \rightarrow \text{End}(\text{Res}_{T \subset B}^G(\text{Spr}_G)) \simeq \text{End}(\mathbb{C}_{T/T}^{\oplus W})$ can be expressed explicitly via the commutative diagram*

$$\begin{array}{ccc} \text{End}(\text{Spr}_G) & \xrightarrow{\quad\quad\quad} & \text{End}(\text{Res}_{T \subset B}^G(\text{Spr}_G)) \\ \downarrow \simeq & & \downarrow \simeq \\ (H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W] & \xrightarrow{\quad\quad\quad} & (H^*(BT) \otimes H^*(T)) \otimes \text{End}_{\mathbb{C}}(\mathbb{C}[W]) \\ \downarrow \simeq & & \downarrow \simeq \\ \text{End}_{(H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W]}((H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W]) & \rightarrow & \text{End}_{H^*(BT) \otimes H^*(T)}((H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W]) \end{array}$$

where the bottom arrow is induced by the restriction of module structure along

$$H^*(BT) \otimes H^*(T) \rightarrow (H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W].$$

(iii) *Similarly, the natural DG-algebra homomorphism $\text{End}(\mathbb{C}_{T/T}) \rightarrow \text{End}(\text{Spr}_G)$ can be identified with*

$$H^*(BT) \otimes H^*(T) \rightarrow (H^*(BT) \otimes H^*(T)) \otimes \mathbb{C}[W].$$

Picking an abstract isomorphism of fields $\mathbb{C} \cong \overline{\mathbb{Q}}_\ell$, we see that Theorem 3.1.1 holds equally well for cohomology with coefficients in $\overline{\mathbb{Q}}_\ell$. In the rest of this section, we will work with $\overline{\mathbb{Q}}_\ell$ coefficients.

3.2. Formality of the graded Grothendieck–Springer sheaf. The main goal of the current subsection is a graded version of Theorem 3.1.1 formulated in the following theorem whose proof will conclude in §3.2.11, after some preliminary preparation.

Theorem 3.2.1. *Let G be a reductive group over $\overline{\mathbb{F}}_q$, $T \subset B$ and W as before.*

(i) *There is an equivalence of DG-algebras*

$$\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}}) \simeq (H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W] \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \otimes \overline{\mathbb{Q}}_\ell[W]$$

where \underline{x} and $\underline{\theta}$ are generators of the cohomology rings $H_{\text{gr}}^*(BT)$ and $H_{\text{gr}}^*(T)$, respectively. In particular, $\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}})$ is formal. Moreover, \underline{x} and $\underline{\theta}$ have degrees $(2, 2)$ and $(2, 1)$ respectively, with the first (resp. second) index indicating graded (resp. cohomological) degrees.

(ii) *There is a natural equivalence $\text{Res}_{T \subset B}^G(\text{Spr}_G^{\text{gr}}) \simeq \overline{\mathbb{Q}}_{\ell, T/T}^{\oplus W}$. Moreover, after taking cohomology, the natural DG-algebra homomorphism $\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}}) \rightarrow \mathcal{E}nd^{\text{gr}}(\text{Res}_{T \subset B}^G(\text{Spr}_G^{\text{gr}})) \simeq \mathcal{E}nd^{\text{gr}}(\overline{\mathbb{Q}}_{\ell, T/T}^{\oplus W})$ can be expressed explicitly via the commutative diagram*

$$\begin{array}{ccc} H^*(\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}})) & \xrightarrow{\quad} & H^*(\mathcal{E}nd^{\text{gr}}(\text{Res}_{T \subset B}^G(\text{Spr}_G^{\text{gr}}))) \\ \downarrow \simeq & & \downarrow \simeq \\ (H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W] & \xrightarrow{\quad} & (H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \mathcal{E}nd_{\overline{\mathbb{Q}}_\ell}(\overline{\mathbb{Q}}_\ell[W]) \\ \downarrow \simeq & & \downarrow \simeq \\ \mathcal{E}nd_{(H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W]}^{\text{gr}}((H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W]) & \rightarrow & \mathcal{E}nd_{H^*(BT) \otimes H_{\text{gr}}^*(T)}^{\text{gr}}((H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W]) \end{array}$$

where the bottom arrow is induced by the restriction of module structure along

$$H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T) \rightarrow (H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W].$$

(iii) *Similarly, after taking cohomology, the natural DG-algebra homomorphism $\mathcal{E}nd^{\text{gr}}(\overline{\mathbb{Q}}_{\ell, T/T}) \rightarrow \mathcal{E}nd^{\text{gr}}(\text{Spr}_G)$ can be identified with*

$$H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T) \rightarrow (H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T)) \otimes \overline{\mathbb{Q}}_\ell[W].$$

Combining with Theorem 2.10.11, we obtain the following result.

Corollary 3.2.2. *The DG-algebra $\text{HH}(H_G^{\text{gr}, \text{ren}})$ is formal and we have an equivalence of DG-algebras*

$$\text{HH}(H_G^{\text{gr}, \text{ren}}) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \otimes \overline{\mathbb{Q}}_\ell[W],$$

where \underline{x} and $\underline{\theta}$ have degrees $(2, 2)$ and $(2, 1)$ respectively, where the first (resp. second) index indicates graded (resp. cohomological) degrees.

3.2.3. The strategy for proving Theorem 3.2.1. The passage from Theorem 3.1.1 to Theorem 3.2.1 is via a spreading argument that we will now explain. Let R be a strictly Henselian discrete valuation ring between $\mathbb{Z}[1/(lN)]$ and \mathbb{C} , where $N \gg 0$. Let $\iota : \text{Spec } \overline{\mathbb{F}}_q \rightarrow \text{Spec } R$ and $j : \text{Spec } \mathbb{C} \rightarrow \text{Spec } R$ be geometric points over the special and generic points of $\text{Spec } R$, respectively. Then, we have the following symmetric monoidal equivalences of categories

$$\text{Vect} \simeq \text{Shv}(\text{Spec } \overline{\mathbb{F}}_q) \xleftarrow[\simeq]{\iota^*} \text{LS}(\text{Spec } R) \xrightarrow[\simeq]{j^*} \text{Shv}(\text{Spec } \mathbb{C}) \simeq \text{Vect},$$

where $\text{LS}(\text{Spec } R)$ denotes the category of $\overline{\mathbb{Q}}_\ell$ -local systems on $\text{Spec } R$. This induces equivalences of categories

$$(3.2.4) \quad \text{Alg}(\text{Vect}) \simeq \text{Alg}(\text{Shv}(\text{Spec } \overline{\mathbb{F}}_q)) \xleftarrow[\simeq]{\iota^*} \text{Alg}(\text{LS}(\text{Spec } R)) \xrightarrow[\simeq]{j^*} \text{Alg}(\text{Shv}(\text{Spec } \mathbb{C})) \simeq \text{Alg}(\text{Vect}).$$

Thus, if we have an algebra in $\text{Alg}(\text{Shv}(\text{Spec } \overline{\mathbb{F}}_q))$ whose formality we would like to establish, it suffices to produce a natural candidate in $\text{Alg}(\text{LS}(\text{Spec } R))$ whose image under j^* is known to be formal in $\text{Alg}(\text{Shv}(\text{Spec } \mathbb{C}))$.

The algebra in question is $\mathcal{E}nd(\text{Spr}_G)$ which we will now spread out to $\text{Spec } R$.

3.2.5. Spreading out. Let G_R denote the split reductive group over $\text{Spec } R$ given by the same root datum as that of G . Fix $T_R \subset B_R$ a pair of a maximal torus and a Borel subgroup. All the objects considered above have natural relative versions over R . We will use the subscript R (resp. $\overline{\mathbb{F}}_q$, resp. \mathbb{C}) in the notation, for example, Spr_{G_R} (resp. $\text{Spr}_{G_{\overline{\mathbb{F}}_q}}$, resp. $\text{Spr}_{G_{\mathbb{C}}}$), when it is necessary to emphasize where these objects live over, i.e., over R (resp. $\overline{\mathbb{F}}_q$, resp. \mathbb{C}).

Let $\text{St}_{G_R} = B_R/B_R \times_{G_R/G_R} B_R/B_R$. Then we have the following composition of correspondences

$$(3.2.6) \quad \begin{array}{ccccc} & & \text{St}_{G_R} & & \\ & \swarrow r & & \searrow s & \\ & B_R/B_R & & B_R/B_R & \\ \swarrow q & & & & \searrow q \\ T_R/T_R & & G_R/G_R & & T_R/T_R \end{array}$$

Lemma 3.2.7 (Mackey filtration). St_{G_R} has a locally closed stratification indexed by $w \in W$

$$\text{St}_{G_R} = \bigsqcup_{w \in W} \text{St}_{G_R}^w$$

such that on $\text{St}_{G_R}^w$, (3.2.6) is identified with

$$\begin{array}{ccccc} & & B_R^w/B_R^w & & \\ & \swarrow i & & \searrow \text{Ad}_w & \\ & B_R/B_R & & B_R/B_R & \\ \swarrow q & & & & \searrow q \\ T_R/T_R & & G_R/G_R & & T_R/T_R \end{array}$$

where $B_R^w = B_R \cap \text{Ad}_w^{-1}(B_R)$.

Proof. We have

$$\begin{aligned} \text{St}_{G_R} &= \text{Map}(S^1, BB_R \times_{BG_R} BB_R) = \text{Map}(S^1, B_R \backslash G_R/B_R) = \bigsqcup_{w \in W} \text{Map}(S^1, B_R \backslash B_R w B_R/B_R) \\ &= \text{Map}(S^1, BB_R^w) = B_R^w/B_R^w. \end{aligned}$$

□

Corollary 3.2.8. $\text{Res}_{T_R \subset B_R}^{G_R} \text{Spr}_{G_R} \simeq \text{Res}_{T_R \subset B_R}^{G_R} \text{Ind}_{T_R \subset B_R}^{G_R} \overline{\mathbb{Q}}_{\ell, T_R/T_R} \simeq \overline{\mathbb{Q}}_{\ell, T_R/T_R}^{\oplus W}$.

Proof. We first show that $\text{Res}_{T_R \subset B_R}^{G_R} \text{Spr}_{G_R}$ is a local system on T_R/T_R concentrated in cohomological degree 0. The filtration in Lemma 3.2.7 implies that $\text{Res}_{T_R \subset B_R}^{G_R} \text{Spr}_{G_R}$ has a filtration whose associated pieces are given by $(q \circ i)_* \overline{\mathbb{Q}}_{\ell, B_R^w/B_R^w}$ which is simply $\overline{\mathbb{Q}}_{\ell, T_R/T_R}$. Thus, $\text{Res}_{T_R \subset B_R}^{G_R} \text{Spr}_{G_R}$ is a complex of local systems. To see that it concentrates in degree 0, it suffices to check the stalk at a point in $T_{\mathbb{C}}/T_{\mathbb{C}}$. But this is now a well-known statement, see, for example, [C, Proposition 3.2].

Generically on T_R/T_R , the map $\text{St}_{G_R} \rightarrow T_R/T_R$ is a trivial W -cover. Thus, on this open dense subset, $\text{Res}_{T_R \subset B_R}^{G_R} \text{Spr}_{G_R}$ is a trivial local system of rank $|W|$. This implies the same statement for $\text{Res}_{T_R \subset B_R}^{G_R} \text{Spr}_{G_R}$ itself as it is the IC-extension of the local system on an open dense subset. □

Corollary 3.2.9. $\pi_{G_R/G_R, *} \mathcal{E}nd(\text{Spr}_{G_R}) \simeq \pi_{\text{St}_{G_R}, *} \overline{\mathbb{Q}}_{\ell, \text{St}_{G_R}}$ is a complex of local systems on $\text{Spec } R$, i.e., an object in $\text{LS}(\text{Spec } R)$. Here, $\mathcal{E}nd$ denotes the sheaf of endomorphisms, and for any R -stack \mathcal{Y}_R , $\pi_{\mathcal{Y}_R} : \mathcal{Y}_R \rightarrow \text{Spec } R$ denotes the structure map of \mathcal{Y}_R .

Proof. The equivalence $\pi_{G_R/G_R, *} \mathcal{E}nd(\text{Spr}_{G_R}) \simeq \pi_{\text{St}_{G_R}, *} \overline{\mathbb{Q}}_{\ell, \text{St}_{G_R}}$ is a standard statement. The second claim follows from the first since

$$\pi_{\text{St}_{G_R}, *} \overline{\mathbb{Q}}_{\ell, \text{St}_{G_R}} \simeq \pi_{T_R/T_R, *} q_* r_* \overline{\mathbb{Q}}_{\ell, \text{St}_{G_R}} \simeq \pi_{T_R/T_R, *} \overline{\mathbb{Q}}_{\ell, T_R/T_R}^{\oplus W} \simeq (\pi_{T_R/T_R, *} \overline{\mathbb{Q}}_{\ell, T_R/T_R})^{\oplus W},$$

where the second equivalence is due to Corollary 3.2.8, and

$$\pi_{T_R/T_R,*} \overline{\mathbb{Q}}_{\ell,T_R/T_R,*} \simeq \pi_{T_R \times BT_R,*} \overline{\mathbb{Q}}_{\ell,T_R \times BT_R,*},$$

which is a complex of local systems. \square

Corollary 3.2.10. $\iota^* \pi_{G_R/G_R,*} \underline{\mathcal{E}nd}(\text{Spr}_{G_R}) \simeq \mathcal{E}nd(\text{Spr}_{G_{\mathbb{F}_q}})$ and $j^* \pi_{G_R/G_R,*} \underline{\mathcal{E}nd}(\text{Spr}_{G_R}) \simeq \mathcal{E}nd(\text{Spr}_{G_{\mathbb{C}}})$.

Proof. We will prove the statement for j^* only; the proof for ι^* is identical. By adjunction, we have a natural map of algebras

$$j^* \pi_{G_R/G_R,*} \underline{\mathcal{E}nd}(\text{Spr}_{G_R}) \rightarrow \pi_{G_{\mathbb{C}}/G_{\mathbb{C}},*} \underline{\mathcal{E}nd}(\text{Spr}_{G_{\mathbb{C}}}) \simeq \mathcal{E}nd(\text{Spr}_{G_{\mathbb{C}}}).$$

It suffices to show that this is an equivalence of the underlying chain complexes. But now, we have

$$j^* \pi_{G_R/G_R,*} \underline{\mathcal{E}nd}(\text{Spr}_{G_R}) \simeq j^* \pi_{\text{St}_{G_R},*} \overline{\mathbb{Q}}_{\ell,\text{St}_{G_R}} \simeq j^* \pi_{T_R/T_R,*} \overline{\mathbb{Q}}_{\ell,T_R/T_R}^{\oplus W} \simeq \pi_{T_{\mathbb{C}}/T_{\mathbb{C}},*} \overline{\mathbb{Q}}_{\ell,T_{\mathbb{C}}/T_{\mathbb{C}}}^{\oplus W} \simeq \mathcal{E}nd(\text{Spr}_{G_{\mathbb{C}}}).$$

Here, the third equivalence is by direct computation (as it only involves the torus) and the other equivalences are due to Corollary 3.2.9, which holds equally over $\overline{\mathbb{F}_q}$ and \mathbb{C} . \square

We are now ready to prove Theorem 3.2.1.

3.2.11. *Proof of Theorem 3.2.1.* Applying the discussion in §3.2.3 to the object $\pi_{G_R/G_R,*} \underline{\mathcal{E}nd}(\text{Spr}_{G_R})$ using Corollaries 3.2.9 and 3.2.10 and the result over \mathbb{C} , Theorem 3.1.1.(i), we obtain the formality of the algebra $\mathcal{E}nd(\text{Spr}_{G_{\mathbb{F}_q}/G_{\mathbb{F}_q}})$. But since the formality of a graded DG-algebra can be detected at the ungraded level, we obtain the formality of $\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}})$ as well. In particular, we have an equivalence of DG-algebras

$$\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}}) \simeq H^*(\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}})) \simeq \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{\theta}] \otimes \overline{\mathbb{Q}}_{\ell}[W]$$

for *some* variables \underline{x} and $\underline{\theta}$ whose cohomology degrees we know (i.e., 2 and 1, respectively) but whose graded degrees still need to be computed.

We note that in the case of a torus, $\text{Spr}_T^{\text{gr}} \simeq \overline{\mathbb{Q}}_{\ell,T/T}$ and we have

$$\mathcal{E}nd^{\text{gr}}(\text{Spr}_T^{\text{gr}}) \simeq H_{\text{gr}}^*(BT) \otimes H_{\text{gr}}^*(T) \simeq \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{\theta}],$$

where \underline{x} and $\underline{\theta}$ have degrees (2, 2) and (2, 1), respectively. We will deduce the general case from this case.

Over $\overline{\mathbb{F}_q}$, we still have the equivalence $\text{Res}_{T_{CB}}^G(\text{Spr}_G) \simeq \overline{\mathbb{Q}}_{\ell,T/T}^{\oplus W}$, which is the precise statement of [C, Proposition 3.2]. In fact, the ungraded version¹⁸ of Theorem 3.2.1.(ii) follows from (3.2.4) and Corollary 3.2.10 and the complex version, which is Theorem 3.1.1.(ii). In particular, at the ungraded level, the natural algebra map

$$\mathcal{E}nd(\text{Spr}_G) \rightarrow \mathcal{E}nd(\text{Res}_{T_{CB}}^G \text{Spr}_G)$$

is identified with

$$\overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{\theta}] \otimes \overline{\mathbb{Q}}_{\ell}[W] \hookrightarrow \mathcal{E}nd_{\overline{\mathbb{Q}}_{\ell}}(\overline{\mathbb{Q}}_{\ell}[W]) \otimes (H^*(BT) \otimes H^*(T)) \simeq \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{\theta}] \otimes \overline{\mathbb{Q}}_{\ell}[W].$$

The grading on the RHS is known, as this is the case of a torus. By degree considerations, \underline{x} and $\underline{\theta}$ on the LHS must have degrees (2, 2) and (2, 1), respectively.

The identifications of the algebra morphisms in Theorem 3.2.1.(ii) and (iii) follows from the ungraded case. \square

Remark 3.2.12. In the above, we used the fact that the formality of a graded DG-algebra (i.e., a DG-algebra with an *extra* formal grading) can be detected after forgetting the grading. This can be seen, for example, by applying the main result of [MR] and the fact that the formation of a certain spectral sequence in loc. cit. commutes with forgetting the formal grading.

We expect that the same statement also holds for the *formality of a morphism* between formal graded DG-algebras. However, we know neither how to prove this statement nor a place where it is

¹⁸That is, we still work over $\overline{\mathbb{F}_q}$, but forget the grading. In other words, we work with Shv rather than Shv_{gr} .

proved. Because of that, the statements appearing in Theorem 3.2.1.(ii) and (iii) are only at the level of cohomology groups.

3.3. An explicit presentation of $\text{Ch}_G^{u, \text{gr}}$. The main goal of this subsection is to give an explicit presentation of $\text{Ch}_G^{u, \text{gr}}$. We will only fully work out type A case.

3.3.1. A generation statement in type A. We first recall the following result which is well-known to experts but we include it here for the reader's convenience.

Proposition 3.3.2. *Let G be a reductive group of type A over $\overline{\mathbb{F}}_q$. Then Ch_G^u is generated by the Grothendieck–Springer sheaf Spr_G .*

Proof. Let $\mathcal{F} \in \text{Ch}_G^u$. Then, by Corollary 2.9.3, we know that \mathcal{F} can be built from successive extensions of irreducible character sheaves. It thus suffices to show that when \mathcal{F} is irreducible, it is a direct summand of Spr_G .

By [Lf, Theorem 4.4.(a)], \mathcal{F} is a summand of $\text{Ind}_{L \subset P}^G(\mathcal{K})$ for some cuspidal character sheaf \mathcal{K} on L , the Levi factor of some parabolic subgroup P of G .¹⁹ The group $A(G) := Z(G)/Z^0(G)$ acts on \mathcal{F} via a character $\chi_{\mathcal{F}}$ which is the composition $A(G) \twoheadrightarrow A(L) \xrightarrow{\chi_{\mathcal{K}}} \overline{\mathbb{Q}}_{\ell}^*$, where $\chi_{\mathcal{K}}$ is the action of $A(L)$ on \mathcal{K} .

Since \mathcal{F} is a unipotent character sheaf, $\chi_{\mathcal{F}}$ is trivial, and hence, so is $\chi_{\mathcal{K}}$. By the classification of cuspidal character sheaves [Le, beginning of page 206], if L is of type A, then there is no cuspidal character sheaf with trivial $\chi_{\mathcal{K}}$.²⁰ This forces $L = T$. Hence, \mathcal{F} is a summand of $\text{Ind}_{T \subset B}^G(\overline{\mathbb{Q}}_{\ell}^*) = \text{Spr}_G$. \square

We now turn to the graded version of the result above.

Corollary 3.3.3. *Let G be a reductive group of type A over $\overline{\mathbb{F}}_q$. Then $\text{Ch}_G^{u, \text{gr}}$ is generated by grading shifts $\text{Spr}_G^{\text{gr}}\langle - \rangle$ of the graded Grothendieck–Springer sheaf. In other words, $\text{Ch}_G^{u, \text{gr}}$ is generated by Spr_G^{gr} as a $\text{Vect}^{\text{gr}, c}$ -module category. Consequently, $\text{Ch}_G^{u, \text{gr}, \text{ren}}$ is compactly generated by Spr_G^{gr} as a Vect^{gr} -module category.*

Proof. As above, it suffices to show that any irreducible perverse graded character sheaf $\mathcal{K} \in \text{Ch}_G^{u, \text{gr}}$ appears as a direct summand of Spr_G^{gr} up to a grading shift. However, this can be checked after forgetting the grading since simplicity implies purity and we have a complete description of simple pure graded perverse sheaves, see [HLb, Theorem 5.2.19].

The last statement follows immediately since

$$\text{Ch}_G^{u, \text{gr}, \text{ren}} \simeq \text{Ind}(\text{Ch}_G^{u, \text{gr}}).$$

\square

Theorem 3.3.4. *Let G be a reductive group of type A over $\overline{\mathbb{F}}_q$. Then, taking $\mathcal{H}\text{om}_{\text{Ch}_G^{u, \text{gr}, \text{ren}}}^{\text{gr}}(\text{Spr}_G^{\text{gr}}, -)$ induces an equivalence of Vect^{gr} -module categories*

$$\begin{aligned} \text{Ch}_G^{u, \text{gr}, \text{ren}} &\simeq \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_{\ell}[W]\text{-Mod}(\text{Vect}^{\text{gr}}) =: (\text{H}_{\text{gr}}^*(BT) \otimes \text{H}_{\text{gr}}^*(T)) \boxtimes \overline{\mathbb{Q}}_{\ell}[W]\text{-Mod}^{\text{gr}} \\ &\simeq \text{HH}(\text{H}_G^{\text{gr}, \text{ren}})\text{-Mod}^{\text{gr}}. \end{aligned}$$

Taking the full subcategory of compact objects, we get

$$\begin{aligned} \text{Ch}_G^{u, \text{gr}} &\simeq \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_{\ell}[W]\text{-Mod}(\text{Vect}^{\text{gr}, c})^{\text{perf}} =: (\text{H}_{\text{gr}}^*(BT) \otimes \text{H}_{\text{gr}}^*(T)) \boxtimes \overline{\mathbb{Q}}_{\ell}[W]\text{-Mod}^{\text{gr}, \text{perf}} \\ &\simeq \text{HH}(\text{H}_G^{\text{gr}, \text{ren}})\text{-Mod}^{\text{gr}, \text{perf}}. \end{aligned}$$

Here, perf denotes the full subcategory consisting of perfect complexes.

Proof. The first statement can be obtained by a standard Barr–Beck–Lurie argument using the generation result in Corollary 3.3.3 and the identification of $\text{HH}(\text{H}_G^{\text{gr}, \text{ren}})$ in Corollary 3.2.2. The second statement follows from the first by taking compact objects. \square

¹⁹Note that by [Lg, (7.1.3)], the cuspidal character sheaves are exactly those coming from cuspidal pairs as in [Le].

²⁰This is stated for SL_n . However, for any group of type A, the calculation can be reduced to SL_n , see [Le, §2.10].

4. A COHERENT REALIZATION OF CHARACTER SHEAVES VIA HILBERT SCHEMES OF POINTS ON \mathbb{C}^2

Working in type A, i.e., $G = \mathrm{GL}_n$ for some n , this section's main result, Theorem 4.4.15, relates the category of graded unipotent character sheaves $\mathrm{Ch}_G^{\mathrm{u,gr}} \simeq \mathrm{Tr}(\mathrm{H}_G^{\mathrm{gr}})$ and the Hilbert scheme of n points on \mathbb{C}^2 . The passage from the categorical trace to the Hilbert scheme of points on \mathbb{C}^2 is given by Koszul duality and a result of Krug [Kb], both of which will be reviewed in §§4.1 & 4.2. In §4.3, we recall the categorical constructions of cohomological shearing and 2-periodization. The relation between the two allows us to introduce an extra formal grading at the cost of having to work with 2-periodic objects. All of these results are then used in §4.4 to prove the main result of this section, Theorem 4.4.15. Finally, in §4.5, we match various objects on the two sides, to be used in §5 to realize the HOMFLY-PT homology of a link geometrically via Hilbert schemes of points.

In this section, we will work exclusively with the case $G = \mathrm{GL}_n$ and adopt the notation $\mathrm{H}_n^{\mathrm{gr}} := \mathrm{H}_{\mathrm{GL}_n}^{\mathrm{gr}} \simeq \mathrm{Ch}^b(\mathrm{SBim}_n)$.

4.1. Koszul duality: a recollection. We will now recall an equivalence of categories coming out of Koszul duality. The materials presented here are classical, but it can also be viewed as a particularly simple case of the theory developed by Arinkin–Gaitsgory in [AG]; for example, see §1.3.5 therein.

4.1.1. *A t -structure on $\mathrm{Ch}_G^{\mathrm{u,gr,ren}}$.* By shearing, we obtain an equivalence of DG-categories

$$\mathrm{Ch}_G^{\mathrm{u,gr,ren}} \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}} \simeq \overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}}$$

where \tilde{x} and $\tilde{\theta}$ live in degrees $(2, 0)$ and $(2, -1)$ respectively. Here, we follow the same convention as in Theorem 3.2.1.

The latter category has a natural t -structure which makes the forgetful functor to $\mathrm{Vect}^{\mathrm{gr}}$ t -exact where $\mathrm{Vect}^{\mathrm{gr}}$ is equipped with the standard t -structure. The equivalence of categories above then endows $\mathrm{Ch}_G^{\mathrm{u,gr,ren}} \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[W]\text{-Mod}^{\mathrm{gr}}$ with a t -structure compatible with the *sheared* t -structure on $\mathrm{Vect}^{\mathrm{gr}}$. Namely, the t -heart of $\mathrm{Vect}^{\mathrm{gr}}$ in this t -structure consisting of complexes whose support lie in degrees (k, k) for $k \in \mathbb{Z}$.

Note that the algebra $\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]$ is connective with respect to this sheared t -structure on $\mathrm{Vect}^{\mathrm{gr}}$, whereas the algebra $\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]$ is connective is the usual t -structure. In fact, by shearing, we have a t -exact equivalence of DG-categories

$$\mathrm{Ch}_G^{\mathrm{u,gr,ren}} \simeq \mathrm{QCoh}((\mathbb{A}^n \times \mathbb{A}^n[-1])/(\mathbb{G}_m \times S_n)),$$

where \mathbb{G}_m scales all coordinates with degree 2.

4.1.2. *Coherent objects.* Following [G], we define

$$\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr,coh}} \subseteq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}} \simeq \mathrm{Ch}_G^{\mathrm{u,gr,ren}}$$

to be the full subcategory spanned by objects of bounded cohomological amplitude and coherent cohomologies (with respect to the t -structure defined in the previous subsection). This category is generated by $\overline{\mathbb{Q}}_\ell[\underline{x}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]$ under finite (co)limits, idempotent splittings, and grading shifts.

4.1.3. *Koszul duality.* The functor of taking $\underline{\theta}$ -invariants

$$\mathrm{inv}_\theta := \mathcal{H}\mathrm{om}_{\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr,coh}}}^{\mathrm{gr}}(\overline{\mathbb{Q}}_\ell[\underline{x}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n], -) : \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr,coh}} \rightarrow \mathrm{Vect}^{\mathrm{gr}}$$

upgrades to an equivalence of categories

$$\mathrm{inv}_\theta^{\mathrm{enh}} : \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr,coh}} \xrightarrow{\simeq} \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr,perf}},$$

where

$$\mathrm{inv}_\theta(\overline{\mathbb{Q}}_\ell[\underline{x}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]) \simeq \mathcal{E}\mathrm{nd}_{\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr,coh}}}^{\mathrm{gr}}(\overline{\mathbb{Q}}_\ell[\underline{x}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]$$

and \underline{y} live in degrees $(-2, 0)$. This equivalence of categories is usually referred to as Koszul duality.

4.1.4. To simplify the notation, we let V denote a graded vector space of dimension n living in graded degree 2 and cohomological degree 0, equipped with a basis and hence also a permutation representation of $W = S_n$. Then,

$$\overline{\mathbb{Q}}_\ell[\underline{\theta}] \simeq \text{Sym } V_\theta[-1], \quad \overline{\mathbb{Q}}_\ell[\underline{x}] \simeq \text{Sym } V_x[-2], \quad \overline{\mathbb{Q}}_\ell[\underline{y}] \simeq \text{Sym } V_y^\vee,$$

where the subscripts x , θ , and y are there just to make it easy to keep track of the names of the variables. To further simplify the notation, we denote

$$\mathcal{A}_n := \text{Sym}(V_x[-2] \oplus V_\theta[-1]) \otimes \overline{\mathbb{Q}}_\ell[S_n]$$

and

$$\mathcal{B}_n := \text{Sym}(V_x[-2] \oplus V_y^\vee) \otimes \overline{\mathbb{Q}}_\ell[S_n].$$

The equivalence of categories above then becomes

$$\text{inv}_\theta^{\text{enh}} : \mathcal{A}_n\text{-Mod}^{\text{gr,coh}} \xrightarrow{\simeq} \mathcal{B}_n\text{-Mod}^{\text{gr,perf}}.$$

4.1.5. Let

$$\text{triv}_\theta := \text{Sym } V_x[-2] \otimes \overline{\mathbb{Q}}_\ell[S_n] \in \mathcal{A}_n\text{-Mod}^{\text{gr,coh}}$$

where $\underline{\theta}$ act trivially, i.e., by 0. Directly from the construction, we have

$$\text{inv}_\theta^{\text{enh}}(\text{triv}_\theta) \simeq \mathcal{B}_n.$$

Moreover, the inverse functor to $\text{inv}_\theta^{\text{enh}}$ is given by taking \underline{y} -coinvariants

$$\text{coinv}_y^{\text{enh}} := \overline{\mathbb{Q}}_\ell \otimes_{\text{Sym } V_y^\vee} -.$$

4.1.6. *Twisting.* For our purposes, it is convenient to twist $\text{inv}_\theta^{\text{enh}}$ and $\text{coinv}_y^{\text{enh}}$ by the sign representation of S_n . We let

$$\begin{aligned} \widetilde{\text{inv}}_\theta^{\text{enh}} &:= \text{Sym}^n V^\vee[1] \otimes \text{inv}_\theta^{\text{enh}}, \\ \text{and } \widetilde{\text{coinv}}_y^{\text{enh}} &:= \text{Sym}^n V[-1] \otimes \text{coinv}_y^{\text{enh}} \end{aligned}$$

be mutually inverse functors

$$(4.1.7) \quad \widetilde{\text{inv}}_\theta^{\text{enh}} : \mathcal{A}_n\text{-Mod}^{\text{gr,coh}} \rightleftarrows \mathcal{B}_n\text{-Mod}^{\text{gr,perf}} : \widetilde{\text{coinv}}_y^{\text{enh}}.$$

4.1.8. *Restricting to $\mathcal{A}_n\text{-Mod}^{\text{gr,perf}}$.* Let

$$\text{triv}_y := \text{Sym}(V_x[-2]) \otimes \overline{\mathbb{Q}}_\ell[S_n] \in \mathcal{B}_n\text{-Mod}^{\text{gr,perf}}$$

where \underline{y} act trivially, i.e., by 0. An easy computation using the self-duality of the Koszul complex shows that

$$\widetilde{\text{coinv}}_y^{\text{enh}}(\text{triv}_y) \simeq \mathcal{A}_n,$$

and hence,

$$\widetilde{\text{inv}}_\theta^{\text{enh}}(\mathcal{A}_n) \simeq \text{triv}_y \simeq \text{Sym}(V_x[-2]) \otimes \overline{\mathbb{Q}}_\ell[S_n].$$

In other words, $\widetilde{\text{inv}}_\theta^{\text{enh}}$ simply “kills” the variables $\underline{\theta}$ in \mathcal{A}_n .

This implies that $\widetilde{\text{inv}}_\theta^{\text{enh}}$ and $\widetilde{\text{coinv}}_y^{\text{enh}}$ restrict to a pair of (eponymous) mutually inverse functors

$$(4.1.9) \quad \widetilde{\text{inv}}_\theta^{\text{enh}} : \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} \rightleftarrows \mathcal{B}_n\text{-Mod}_{\text{nilp}_y}^{\text{gr,perf}} : \widetilde{\text{coinv}}_y^{\text{enh}},$$

where the subscript nilp_y denotes the fact that the variables \underline{y} act nilpotently. This is because on the one hand, the LHS is generated by \mathcal{A}_n under finite (co)limits, idempotent splittings, and grading shifts and on the other hand, \mathcal{A}_n is sent to triv_y on which \underline{y} act by 0.

The equivalence (4.1.9) is in fact a particularly simple case of the theory of singular support developed in [AG] where perfect complexes have 0-singular support.

4.1.10. *Unipotent character sheaves.* The discussion above gives the following Koszul-dual descriptions of $\mathrm{Ch}_G^{\mathrm{u,gr}}$ and $\mathrm{Ch}_G^{\mathrm{u,gr,ren}}$ when $G = \mathrm{GL}_n$.

Proposition 4.1.11. *Let $G = \mathrm{GL}_n$ be the general linear group of rank n over $\overline{\mathbb{F}}_q$. Then, we have an equivalence of $\mathrm{Vect}^{\mathrm{gr,c}}$ -module categories*

$$\mathrm{Ch}_G^{\mathrm{u,gr}} \simeq \mathcal{B}_n\text{-Mod}_{\mathrm{nilp}_{\underline{y}}}^{\mathrm{gr,perf}}.$$

Taking Ind-completion, we get an equivalence of $\mathrm{Vect}^{\mathrm{gr}}$ -module categories

$$\mathrm{Ch}_G^{\mathrm{u,gr,ren}} \simeq \mathcal{B}_n\text{-Mod}_{\mathrm{nilp}_{\underline{y}}}^{\mathrm{gr}}.$$

Proof. The second statement follows from the first by taking the Ind-completion on both sides. The first statement follows from Theorem 3.3.4 and (4.1.9). \square

4.2. **Hilbert scheme of points on \mathbb{C}^2 .** We will now recall the main results of [Kb] which gives an explicit presentation of the categories of quasi-coherent sheaves on the Hilbert schemes of points on \mathbb{C}^2 . This will allow us to relate Hilbert scheme of points on \mathbb{C}^2 and $\mathrm{Ch}_G^{\mathrm{u,gr}}$ and $\mathrm{Ch}_G^{\mathrm{u,gr,ren}}$ (when $G = \mathrm{GL}_n$), which will be discussed in §4.3.

As we have been working over $\overline{\mathbb{Q}}_\ell$ rather than \mathbb{C} , our Hilbert schemes are in fact $\mathrm{Hilb}_n(\overline{\mathbb{Q}}_\ell^2)$ which live over $\overline{\mathbb{Q}}_\ell$. Although the two are isomorphic as abstract varieties due to the isomorphism $\overline{\mathbb{Q}}_\ell \simeq \mathbb{C}$, we will keep using $\overline{\mathbb{Q}}_\ell$ for the sake of consistency. In fact, all varieties appearing in this subsection are over $\overline{\mathbb{Q}}_\ell$ and we will employ base-field-agnostic notation as much as possible; for example, \mathbb{A}^2 will be used to denote the 2-dimensional affine space over $\overline{\mathbb{Q}}_\ell$.

4.2.1. *The isospectral Hilbert scheme.* Let Hilb_n denote the Hilbert scheme of points on \mathbb{A}^2 , $\mathbb{A}^{2n}/S_n = (\mathbb{A}^2)^n/S_n$ the stack quotient of \mathbb{A}^{2n} by the permutation action of S_n , and $\mathbb{A}^{2n} // S_n$ the GIT quotient. There is a natural map $g : \mathbb{A}^{2n}/S_n \rightarrow \mathbb{A}^{2n} // S_n$ and the Hilbert–Chow morphism $H : \mathrm{Hilb}_n \rightarrow \mathbb{A}^{2n} // S_n$. The isospectral Hilbert scheme is the *reduced* pullback

$$\begin{array}{ccc} \mathrm{Iso}_n & \longrightarrow & \mathbb{A}^{2n} \\ \downarrow & & \downarrow \\ \mathrm{Hilb}_n & \longrightarrow & \mathbb{A}^{2n} // S_n. \end{array}$$

Iso_n has a natural S_n -action compatible with the permutation S_n -action on \mathbb{A}^{2n} and the trivial S_n -action on Hilb_n . Thus, we obtain the following commutative diagram

$$(4.2.2) \quad \begin{array}{ccc} \mathrm{Iso}_n/S_n & \xrightarrow{p} & \mathbb{A}^{2n}/S_n \\ q \downarrow & & \downarrow g \\ \mathrm{Hilb}_n & \xrightarrow{H} & \mathbb{A}^{2n} // S_n. \end{array}$$

4.2.3. *A derived equivalence.* In the notation above, one of the main results of [Kb] (which is itself a variant of [BKR] but has a more convenient form for us) takes the following form.

Theorem 4.2.4 ([Kb, Proposition 2.8]). *The functor $\Psi := q_*p^* : \mathrm{QCoh}(\mathbb{A}^{2n}/S_n) \rightarrow \mathrm{QCoh}(\mathrm{Hilb}_n)$ is an equivalence of categories, where all functors are derived and where $\mathrm{QCoh}(-)$ denotes the (∞) -derived category of quasi-coherent sheaves.*

Passing to the full subcategories spanned by compact objects, we obtain an equivalence $\Psi : \mathrm{Perf}(\mathbb{A}^{2n}/S_n) \xrightarrow{\simeq} \mathrm{Perf}(\mathrm{Hilb}_n)$.

4.2.5. \mathbb{G}_m -equivariant structures. Each of the terms in (4.2.2) has a natural \mathbb{G}_m^2 -action induced by the action of \mathbb{G}_m^2 on \mathbb{A}^2 where the first (resp. second) factor of \mathbb{G}_m^2 scales the first (resp. second) factor of \mathbb{A}^2 by weight 1 (resp. 2). Moreover, all maps are compatible with this action. We thus obtain an equivariant form of the theorem above. By abuse of notation, we will employ the same notation for the equivariant case as the non-equivariant case above. Note also that the category $\mathrm{QCoh}(\mathrm{Hilb}_n/(\mathbb{G}_m^2))$ below also appears as $\mathrm{QCoh}_{\mathbb{G}_m^2}(\mathrm{Hilb}_n)$ (or some variant thereof) in the literature.

Corollary 4.2.6. *The functor $\Psi := q_* p^* : \mathrm{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2)) \rightarrow \mathrm{QCoh}(\mathrm{Hilb}_n/(\mathbb{G}_m^2))$ is an equivalence of categories. The same statement applies when restricted to the full subcategories of compact objects (i.e., perfect complexes).*

This equivalence allows us to have an explicit presentation of $\mathrm{QCoh}(\mathrm{Hilb}_n/(\mathbb{G}_m^2))$ as a plain (as opposed to a symmetric monoidal) DG-category.

Proposition 4.2.7. *We have an equivalence of categories*

$$\mathrm{QCoh}(\mathrm{Hilb}_n/(\mathbb{G}_m^2)) \xrightarrow{\Psi^{-1}} \mathrm{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2)) \simeq \overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{y}] \otimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}, \mathrm{gr}},$$

where the superscript gr, gr indicates the fact that we are working with bi-graded complexes. Moreover, \tilde{x} and \tilde{y} have cohomological degree 0 and bi-degrees (wrt. the superscript gr, gr) (1, 0) and (0, 2), respectively.

Proof. Only the last equivalence needs to be proved. Applying Barr–Beck–Lurie to the following adjunction

$$\mathrm{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2)) \xrightleftharpoons[p_*]{p^*} \mathrm{QCoh}(B(S_n \times \mathbb{G}_m^2)) \simeq \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}, \mathrm{gr}},$$

where $p : \mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2) \rightarrow B(S_n \times \mathbb{G}_m^2)$ is the natural map, we obtain an equivalence of categories

$$\mathrm{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2)) \simeq \overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{y}]\text{-Mod}(\overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}, \mathrm{gr}}).$$

But the latter is equivalent to

$$\overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{y}] \otimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}, \mathrm{gr}}$$

and we are done. \square

Remark 4.2.8. Instead of (1, 0) and (0, 2), we could have chosen any other bigradings for the \tilde{x} and \tilde{y} variables. As we will see, these specific choices are made because of the connection to character sheaves and HOMFLY-PT homology. For example, see §4.4.6 for the relation to the grading on the category of graded unipotent character sheaves.

4.2.9. Supports. Let $i_{\tilde{x}} : \mathbb{A}_{\tilde{x}}^n/S_n \rightarrow \mathbb{A}^{2n}/S_n$ denote the closed subscheme defined by the vanishing of all of the \tilde{y} -coordinates. Let $\mathrm{Hilb}_{n, \tilde{x}}$ be the pullback

$$\begin{array}{ccc} \mathrm{Hilb}_{n, \tilde{x}} & \longrightarrow & \mathrm{Hilb}_n \\ \downarrow & & \downarrow \\ \mathbb{A}_{\tilde{x}}^n/S_n & \xrightarrow{i_{\tilde{x}}} & \mathbb{A}^{2n}/S_n \end{array}$$

For any closed embedding of schemes (or in fact, stacks) $Z \subset X$, we let $\mathrm{QCoh}(X)_Z$ denote the full subcategory of $\mathrm{QCoh}(X)$ consisting of objects whose supports lie in Z . Similarly, we let $\mathrm{Perf}(X)_Z$ denote the full subcategory of $\mathrm{Perf}(X)$ spanned by objects whose supports lie in Z .

Lemma 4.2.10. *The equivalence Ψ above restricts to the following equivalences of categories*

$$\begin{aligned} \overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{y}] \otimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}_{\mathrm{nilp}_{\tilde{y}}}^{\mathrm{gr}, \mathrm{gr}} &\simeq \mathrm{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2))_{\mathbb{A}_{\tilde{x}}^n/(S_n \times \mathbb{G}_m^2)} \\ &\xrightarrow{\Psi} \mathrm{QCoh}(\mathrm{Hilb}_n/(\mathbb{G}_m^2))_{\mathrm{Hilb}_{n, \tilde{x}}/(\mathbb{G}_m^2)}. \end{aligned}$$

The same statement applies when restricted to the full subcategories of compact objects (i.e., perfect complexes).

Proof. For brevity's sake, we suppress the \mathbb{G}_m -equivariant structures (i.e., the gradings) from the notation.

From (4.2.2), we see that Ψ is compatible with the action of $\mathrm{QCoh}(\mathbb{A}^{2n}/S_n)$. Now, we note that the full subcategories of interest are cut out precisely by the condition that the variables \tilde{y} (from \mathbb{A}^{2n}/S_n) act nilpotently.

Alternatively (and more categorically), one can use the theory of support as discussed in, for example, [AG, §3.5], to conclude:

$$\begin{aligned} \mathrm{QCoh}(\mathbb{A}^{2n}/S_n)_{\mathbb{A}_{\tilde{x}}^n/S_n} &\simeq \mathrm{QCoh}(\mathbb{A}^{2n}/S_n) \otimes_{\mathrm{QCoh}(\mathbb{A}^{2n}/S_n)} \mathrm{QCoh}(\mathbb{A}^{2n} // S_n)_{\mathbb{A}_{\tilde{x}}^n/S_n} \\ &\simeq \mathrm{QCoh}(\mathrm{Hilb}_n) \otimes_{\mathrm{QCoh}(\mathbb{A}^{2n}/S_n)} \mathrm{QCoh}(\mathbb{A}^{2n} // S_n)_{\mathbb{A}_{\tilde{x}}^n/S_n} \\ &\simeq \mathrm{QCoh}(\mathrm{Hilb}_n)_{\mathrm{Hilb}_{n,\tilde{x}}}. \end{aligned}$$

□

4.3. Cohomological shearing and 2-periodization. The algebra $\overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{y}] \otimes \overline{\mathbb{Q}}_\ell[S_n]$ appearing in Proposition 4.2.7 and the algebra $\mathcal{B}_n = \overline{\mathbb{Q}}_\ell[x, y] \otimes \overline{\mathbb{Q}}_\ell[S_n]$ appearing in §4.1.4 are almost the same except for the mismatch in the cohomological gradings the number of formal gradings.

In this subsection, we will discuss two general categorical constructions which will allow us, in §4.4, to relate the categories of modules over these two rings, and hence, also to relate the category of (quasi-)coherent sheaves on Hilb_n and $\mathrm{Ch}_G^{u, \mathrm{gr}, (\mathrm{ren})}$ for $G = \mathrm{GL}_n$. One of them, known as cohomological shearing, reduces the number of formal gradings whereas the other, 2-periodization, increases the number of gradings. As it turns out, these two are equivalent, which is the content of Proposition 4.3.16 below.

The materials presented here are more or less standard, at least among the experts. We include it here since we cannot find a place where everything is written down in a way that is convenient for us.

The discussion in this subsection applies to both small and large categories. For brevity's sake, we will only discuss the large category case. As usual, the small case can be obtained by passing to compact objects.

4.3.1. Shearing functors on $\mathrm{Vect}^{\mathrm{gr}}$. Consider the shear functors

$$\begin{aligned} \mathrm{sh}^{\leftarrow} : \mathrm{Vect}^{\mathrm{gr}} &\rightarrow \mathrm{Vect}^{\mathrm{gr}} & \mathrm{sh}^{\rightarrow} : \mathrm{Vect}^{\mathrm{gr}} &\rightarrow \mathrm{Vect}^{\mathrm{gr}} \\ (V_i)_i &\mapsto (V_i[2i])_i & (V_i)_i &\mapsto (V_i[-2i])_i. \end{aligned}$$

Note that these are equivalences of symmetric monoidal categories.

For $A^{\mathrm{gr}} \in \mathrm{Vect}^{\mathrm{gr}}$, we let $A^{\mathrm{gr}, \leftarrow} := \mathrm{sh}^{\leftarrow}(A^{\mathrm{gr}}) \in \mathrm{Vect}^{\mathrm{gr}}$ and $A^{\mathrm{gr}, \rightarrow} := \mathrm{sh}^{\rightarrow}(A^{\mathrm{gr}}) \in \mathrm{Vect}^{\mathrm{gr}}$. Since sh^{\leftarrow} and $\mathrm{sh}^{\rightarrow}$ are symmetric monoidal equivalences, $A^{\mathrm{gr}, \leftarrow}$ (resp. $A^{\mathrm{gr}, \rightarrow}$) is equipped with a natural algebra structure if and only if A^{gr} is.

4.3.2. Shearing a $\mathrm{Vect}^{\mathrm{gr}}$ -module structure. Since $\mathrm{Vect}^{\mathrm{gr}}$ is symmetric monoidal, any $\mathcal{C}^{\mathrm{gr}} \in \mathrm{Vect}^{\mathrm{gr}}\text{-Mod}$ can be upgraded naturally to a $\mathrm{Vect}^{\mathrm{gr}}$ -bimodule category $\mathcal{C} \in \mathrm{Vect}^{\mathrm{gr}}\text{-BiMod}$. We visualize them as $\mathrm{Vect}^{\mathrm{gr}}$ acting on the left and on the right even though they all come from the left module structure.

Remark 4.3.3. For us, the right $\mathrm{Vect}^{\mathrm{gr}}$ -module structure is important only for the purpose of taking relative tensor products. We will generally ignore this structure unless the formation of relative tensor products is involved.

For each of the left/right module structures, we can precompose the action of $\mathrm{Vect}^{\mathrm{gr}}$ with sh^{\leftarrow} to obtain a new module structure. For example, ${}^{\rightarrow}\mathcal{C}^{\mathrm{gr}, \leftarrow}$ has the following $\mathrm{Vect}^{\mathrm{gr}}$ -bimodule structure²¹

$$\overline{\mathbb{Q}}_\ell\langle i \rangle \boxtimes c \boxtimes \overline{\mathbb{Q}}_\ell\langle j \rangle \mapsto c\langle i+j \rangle[2i-2j].$$

Here, the positions of the arrows with respect to the category indicate which of the left or right module structure we are shearing, and the directions of the arrows indicate which shear we use. A missing arrow indicates that shearing does not occur; for example, $\mathcal{C}^{\mathrm{gr}, \leftarrow}$ has a sheared $\mathrm{Vect}^{\mathrm{gr}}$ -action on the right

²¹Note that the formula below is compatible with the definitions of $\mathrm{sh}^{\rightarrow}$ and sh^{\leftarrow} since, for example, $\overline{\mathbb{Q}}_\ell\langle i \rangle$ lives in graded degree $-i$.

while keeping the action on the left unchanged. Note that these modifications only change the action of Vect^{gr} while keeping the underlying DG-category intact.

4.3.4. The following diagram demonstrates how the functors sh^{\leftarrow} and sh^{\rightarrow} interact with Vect^{gr} -bimodule structures

$$\Rightarrow \text{Vect}^{\text{gr}, \Rightarrow} \xrightleftharpoons[\text{sh}^{\rightarrow}]{\text{sh}^{\leftarrow}} \text{Vect}^{\text{gr}} \xrightleftharpoons[\text{sh}^{\rightarrow}]{\text{sh}^{\leftarrow}} \Leftarrow \text{Vect}^{\text{gr}, \Leftarrow},$$

where all functors are equivalences as morphisms in $\text{Vect}^{\text{gr}}\text{-BiMod}$. Similarly, we can mix and match the directions of the arrows; For example

$$\text{sh}^{\leftarrow} : \text{Vect}^{\text{gr}, \Rightarrow} \xrightarrow{\sim} \Leftarrow \text{Vect}^{\text{gr}}.$$

Shearing Vect^{gr} -bimodule structures can be written naturally in terms of relative tensors. For example,

$$\mathcal{C}^{\text{gr}, \Leftarrow} \simeq \mathcal{C}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \text{Vect}^{\text{gr}, \Leftarrow} \quad \text{and} \quad \Rightarrow \mathcal{C}^{\text{gr}} \simeq \Rightarrow \text{Vect}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}}.$$

4.3.5. *Shearing $A^{\text{gr}}\text{-Mod}^{\text{gr}}$.* Let A^{gr} be a graded DG-algebra, i.e., $A^{\text{gr}} \in \text{Alg}(\text{Vect}^{\text{gr}})$. Then, the category of graded A^{gr} -modules, $A^{\text{gr}}\text{-Mod}^{\text{gr}} := A^{\text{gr}}\text{-Mod}(\text{Vect}^{\text{gr}}) \in \text{Vect}^{\text{gr}}\text{-Mod}$, is naturally a Vect^{gr} -module category, and hence, also an object in $\text{Vect}^{\text{gr}}\text{-BiMod}$, as discussed above. A similar discussion as in the case of Vect^{gr} gives the following equivalences of objects in $\text{Vect}^{\text{gr}}\text{-Mod}$

$$\Rightarrow (A^{\text{gr}, \Rightarrow}\text{-Mod}^{\text{gr}, \Rightarrow}) \xrightleftharpoons[\text{sh}^{\rightarrow}]{\text{sh}^{\leftarrow}} A^{\text{gr}}\text{-Mod}^{\text{gr}} \xrightleftharpoons[\text{sh}^{\rightarrow}]{\text{sh}^{\leftarrow}} \Leftarrow (A^{\text{gr}, \Leftarrow}\text{-Mod}^{\text{gr}, \Leftarrow}).$$

Moreover, as above, we can mix and match the directions of the arrows.

Replacing A^{gr} by $A^{\text{gr}, \Leftarrow}$, we obtain the following equivalences of objects in $\text{Vect}^{\text{gr}}\text{-BiMod}$

$$A^{\text{gr}}\text{-Mod}^{\text{gr}, \Rightarrow} \xrightleftharpoons[\text{sh}^{\rightarrow}]{\text{sh}^{\leftarrow}} \Leftarrow (A^{\text{gr}, \Leftarrow}\text{-Mod}^{\text{gr}})$$

and

$$A^{\text{gr}}\text{-Mod}^{\text{gr}, \Leftarrow} \xrightleftharpoons[\text{sh}^{\leftarrow}]{\text{sh}^{\rightarrow}} \Rightarrow (A^{\text{gr}, \Rightarrow}\text{-Mod}^{\text{gr}}).$$

4.3.6. *Sheared degrading.* Let $\mathcal{C}^{\text{gr}} \in \text{Vect}^{\text{gr}}\text{-Mod}$, then we can form the degraded version \mathcal{C} of \mathcal{C}^{gr}

$$\mathcal{C} := \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}},$$

where the Vect^{gr} -module structure on Vect is given by the symmetric monoidal functor

$$\begin{aligned} \text{oblv}_{\text{gr}} : \text{Vect}^{\text{gr}} &\rightarrow \text{Vect} \\ (V_i)_i &\mapsto \bigoplus_i V_i \end{aligned}$$

which forgets the grading on Vect^{gr} .

We note that the functor of forgetting the grading is also defined for \mathcal{C}^{gr}

$$\text{oblv}_{\text{gr}} : \mathcal{C}^{\text{gr}} \simeq \text{Vect}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \xrightarrow{\text{oblv}_{\text{gr}} \otimes \text{id}_{\mathcal{C}^{\text{gr}}}} \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \mathcal{C}.$$

4.3.7. The sheared degradings of \mathcal{C}^{gr} , denoted by \mathcal{C}^{\Leftarrow} and $\mathcal{C}^{\Rightarrow}$, are defined to be the usual degradings of $\Rightarrow \mathcal{C}^{\text{gr}}$ and $\Leftarrow \mathcal{C}^{\text{gr}}$, respectively (note the reversal of the arrows!)

$$\mathcal{C}^{\Rightarrow} := \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \Leftarrow \mathcal{C}^{\text{gr}} \quad \text{and} \quad \mathcal{C}^{\Leftarrow} := \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \Rightarrow \mathcal{C}^{\text{gr}}.$$

Remark 4.3.8. In general, \mathcal{C} , \mathcal{C}^{\Leftarrow} , and $\mathcal{C}^{\Rightarrow}$ are different as DG-categories. However, the case where $\mathcal{C}^{\text{gr}} = \text{Vect}^{\text{gr}}$ is special as we always have an equivalence of DG-categories

$$(4.3.9) \quad \text{Vect} \xrightarrow[\simeq]{V \mapsto V \boxtimes \bar{\mathbb{Q}}_{\ell}} \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \Leftarrow \text{Vect}^{\text{gr}} =: \text{Vect}^{\Rightarrow} \quad \text{and} \quad \text{Vect} \xrightarrow[\simeq]{V \mapsto V \boxtimes \bar{\mathbb{Q}}_{\ell}} \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \Rightarrow \text{Vect}^{\text{gr}} =: \text{Vect}^{\Leftarrow}.$$

Since Vect has a natural Vect^{gr} -module category structure, we can shear this action and obtain, for example, Vect^{\Leftarrow} and $\text{Vect}^{\Rightarrow}$. These two are in fact equivalent to Vect^{\Leftarrow} and $\text{Vect}^{\Rightarrow}$, respectively, which explains the reversal of the arrows in the definition of the sheared degrading procedure.

Indeed, the right action of Vect^{gr} on $\text{Vect}^{\Rightarrow}$ is as follows: $\overline{\mathbb{Q}}_\ell\langle i\rangle[j]$ sends $V \boxtimes \overline{\mathbb{Q}}_\ell$ to

$$V \boxtimes (\overline{\mathbb{Q}}_\ell\langle i\rangle[j]) \simeq V \boxtimes (\overline{\mathbb{Q}}_\ell\langle i\rangle[-2i][j+2i]) \simeq (V[j+2i]) \boxtimes \overline{\mathbb{Q}}_\ell,$$

which corresponds to $V[j+2i] \in \text{Vect}$ under the equivalence of categories (4.3.9). But this is precisely the \Rightarrow -sheared action of Vect^{gr} on Vect on the right.

4.3.10. Sheared degradings can be written in a natural way as relative tensors of categories

$$\mathcal{C}^{\Leftarrow} \simeq \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} \text{Vect}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \text{Vect}^{\Leftarrow} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \text{Vect}^{\Leftarrow} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}}$$

Similarly,

$$\mathcal{C}^{\Rightarrow} \simeq \text{Vect}^{\Rightarrow} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \text{Vect}^{\Rightarrow} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}}.$$

4.3.11. *Sheared degrading A^{gr} -Mod.* Let $A^{\text{gr}} \in \text{Alg}(\text{Vect}^{\text{gr}})$ be as above and consider the category of (un-graded) A^{gr} -modules, denoted by $\text{oblv}_{\text{gr}}(A^{\text{gr}})\text{-Mod}$. By abuse of notation, when confusion is unlikely, we also write $A^{\text{gr}}\text{-Mod} := \text{oblv}_{\text{gr}}(A^{\text{gr}})\text{-Mod}$.

Clearly, $A^{\text{gr}}\text{-Mod} \simeq \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} A^{\text{gr}}\text{-Mod}^{\text{gr}}$ is a degrading of $A^{\text{gr}}\text{-Mod}^{\text{gr}}$. But we also have sheared degradings as defined in §4.3.6. Namely,

$$A^{\text{gr}}\text{-Mod}^{\Leftarrow} := \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} (A^{\text{gr}}\text{-Mod}^{\text{gr}}) \xrightarrow[\simeq]{\text{id}_{\text{Vect}} \otimes \text{sh}^{\Leftarrow}} \text{Vect} \otimes_{\text{Vect}^{\text{gr}}} A^{\text{gr},\Leftarrow}\text{-Mod}^{\text{gr},\Leftarrow} \simeq \text{oblv}_{\text{gr}}(A^{\text{gr},\Leftarrow})\text{-Mod}^{\Leftarrow},$$

and similarly for $A^{\text{gr}}\text{-Mod}^{\Rightarrow}$.

Ignoring the right Vect^{gr} -actions (see also Remark 4.3.3), we have the following equivalences of DG-categories

$$(4.3.12) \quad A^{\text{gr}}\text{-Mod}^{\Leftarrow} \simeq \text{oblv}_{\text{gr}}(A^{\text{gr},\Leftarrow})\text{-Mod} \quad \text{and} \quad A^{\text{gr}}\text{-Mod}^{\Rightarrow} \simeq \text{oblv}_{\text{gr}}(A^{\text{gr},\Rightarrow})\text{-Mod}.$$

4.3.13. *2-periodization.* We will now turn to 2-periodization. We start with the simplest example of 2-periodization and its interaction with sheared degrading.

Let $\overline{\mathbb{Q}}_\ell[u, u^{-1}] \in \text{ComAlg}(\text{Vect}^{\text{gr}})$ be a commutative algebra object where u is in graded degree 1 and cohomological degree 0. It is easy to see that the functor of extracting the graded degree 0 part

$$\overline{\mathbb{Q}}_\ell[u, u^{-1}]\text{-Mod}^{\text{gr}} \xrightarrow[\simeq]{(M_i)_i \mapsto M_0} \text{Vect}$$

is an equivalence of Vect^{gr} -module categories where the actions of Vect^{gr} are the obvious ones (i.e., no shearing). The inverse functor is given by $V \mapsto \overline{\mathbb{Q}}_\ell[u, u^{-1}] \otimes V$.

The discussion above thus gives us the following equivalences

$$\text{Vect}^{\Leftarrow} \simeq \text{Vect}^{\Leftarrow} \xrightarrow[\simeq]{\overline{\mathbb{Q}}_\ell[u, u^{-1}] \otimes -} \overline{\mathbb{Q}}_\ell[u, u^{-1}]\text{-Mod}^{\text{gr},\Leftarrow} \xrightarrow[\simeq]{\text{sh}^{\Leftarrow}} \Rightarrow(\overline{\mathbb{Q}}_\ell[u, u^{-1}]\text{-Mod}^{\text{gr}})$$

$\overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow} \otimes -$

and,

$$\text{Vect}^{\Rightarrow} \simeq \text{Vect}^{\Rightarrow} \xrightarrow[\simeq]{\overline{\mathbb{Q}}_\ell[u, u^{-1}] \otimes -} \overline{\mathbb{Q}}_\ell[u, u^{-1}]\text{-Mod}^{\text{gr},\Rightarrow} \xrightarrow[\simeq]{\text{sh}^{\Leftarrow}} \Leftarrow(\overline{\mathbb{Q}}_\ell[u, u^{-1}]\text{-Mod}^{\text{gr}}).$$

$\overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow} \otimes -$

Here, by construction, $\overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow}$ (resp. $\overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}$) is the algebra of Laurent polynomials generated by 1 element living in graded degree 1 and cohomological degree 2 (resp. -2).

In particular, we have

$$(4.3.14) \quad \Leftarrow \text{Vect}^{\Leftarrow} \simeq \Leftarrow \text{Vect}^{\Leftarrow} \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}]\text{-Mod}^{\text{gr}} \quad \text{and} \quad \Rightarrow \text{Vect}^{\Rightarrow} \simeq \Rightarrow \text{Vect}^{\Rightarrow} \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}\text{-Mod}^{\text{gr}}.$$

4.3.15. We will now turn to the general case.

Let $\mathcal{C}^{\text{gr}} \in \text{Vect}^{\text{gr}}\text{-Mod}$ be as above. Then, the positive and negative 2-periodizations of \mathcal{C}^{gr} are defined to be

$$\mathcal{C}^{\text{gr}, \text{per}_+} := \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow}\text{-Mod}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow}\text{-Mod}(\mathcal{C}^{\text{gr}})$$

and

$$\mathcal{C}^{\text{gr}, \text{per}_-} := \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}\text{-Mod}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}\text{-Mod}(\mathcal{C}^{\text{gr}}),$$

respectively.

Note that $\overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}$ (resp. $\overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow}$) is equivalent to $\overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]$ where β lives in graded degree 1 and cohomological degree -2 (resp. 2). The category of module objects over $\overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]$ is thus the category of (graded) 2-periodic objects appearing in the literature.

The grading allows one to absorb 2-periodicity. In fact, the 2-periodization construction agrees with the sheared degrading construction from above.

Proposition 4.3.16. *Let $\mathcal{C}^{\text{gr}} \in \text{Vect}^{\text{gr}}\text{-Mod}$. Then, we have natural equivalences of Vect^{gr} -module categories*

$$\mathcal{C}^{\text{gr}, \text{per}_-} \simeq \Rightarrow(\mathcal{C}^{\Rightarrow}) \quad \text{and} \quad \mathcal{C}^{\text{gr}, \text{per}_+} \simeq \Leftarrow(\mathcal{C}^{\Leftarrow}).$$

Proof. We treat the case of per_- as the other case is similar. We have

$$\mathcal{C}^{\text{gr}, \text{per}_-} := \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}\text{-Mod}^{\text{gr}} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \text{Vect}^{\Rightarrow} \otimes_{\text{Vect}^{\text{gr}}} \mathcal{C}^{\text{gr}} \simeq \mathcal{C}^{\Rightarrow},$$

where the second and third equivalences are due to (4.3.14) and §4.3.10, respectively. \square

Remark 4.3.17. We have the following commutative diagrams of symmetric monoidal categories

$$\begin{array}{ccc} \text{Vect}^{\text{gr}} & \xrightarrow{\text{oblv}_{\text{gr}} \circ \text{sh}^{\Rightarrow}} & \text{Vect} \\ \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow} \otimes - \downarrow & \nearrow M \mapsto M_0 & \uparrow \\ \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Leftarrow}\text{-Mod}^{\text{gr}} & \xlongequal{\quad} & \text{Vect}^{\text{gr}, \text{per}_-} \end{array} \quad \begin{array}{ccc} \text{Vect}^{\text{gr}} & \xrightarrow{\text{oblv}_{\text{gr}} \circ \text{sh}^{\Leftarrow}} & \text{Vect} \\ \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow} \otimes - \downarrow & \nearrow M \mapsto M_0 & \uparrow \\ \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow}\text{-Mod}^{\text{gr}} & \xlongequal{\quad} & \text{Vect}^{\text{gr}, \text{per}_+} \end{array}$$

Thus, by construction, the action of Vect^{gr} on $\Rightarrow(\mathcal{C}^{\Rightarrow})$ (resp. $\Leftarrow(\mathcal{C}^{\Leftarrow})$) factors through $\text{Vect}^{\text{gr}, \text{per}_-}$ (resp. $\text{Vect}^{\text{gr}, \text{per}_+}$). On the other hand, $\mathcal{C}^{\text{gr}, \text{per}_-}$ (resp. $\mathcal{C}^{\text{gr}, \text{per}_+}$) are equipped with natural actions of $\text{Vect}^{\text{gr}, \text{per}_-}$ (resp. $\text{Vect}^{\text{gr}, \text{per}_+}$).

Chasing through the definitions, it is easy to see that the two actions are compatible. In other words, the two equivalences in Proposition 4.3.16 are equivalences of $\text{Vect}^{\text{gr}, \text{per}_-}$ -(resp. $\text{Vect}^{\text{gr}, \text{per}_+}$)-module categories.

4.3.18. *More formal gradings.* In the above, the “background category” is Vect in the sense that all categories are DG-categories, i.e., they are Vect -module categories. Then, we work with categories with one extra grading, i.e., with Vect^{gr} -module categories, and consider various categorical operations using this structure. We could have started with Vect^{gr} -module categories but still added another grading and worked with $\text{Vect}^{\text{gr}, \text{gr}}$ -module categories. Everything discussed above still goes through except that now, everything has one more grading. For example, degrading goes from $\text{Vect}^{\text{gr}, \text{gr}}$ -module categories to Vect^{gr} -categories.²² This is the setting that we will work with below.

4.4. **2-periodic Hilbert schemes and character sheaves.** We will now relate Hilbert schemes of points and character sheaves, using the procedure of 2-periodization discussed above to make the precise statement.

²²In fact, we could, more generally, work with $(\text{Vect}^{\text{gr}})^{\otimes n}$ -module categories and then add one more grading to get $n+1$ gradings. We will not need this generality in the current paper.

4.4.1. Introduce an extra grading. By default, all of our categories are singly graded in the sense that they are Vect^{gr} -(or, if we work with the small variant, $\text{Vect}^{\text{gr},c}$)-module categories. Note that any DG-category can be viewed as a Vect^{gr} -module category via the symmetric monoidal functor $\text{oblv}_{\text{gr}} : \text{Vect}^{\text{gr}} \rightarrow \text{Vect}$. In particular, any Vect^{gr} -module category is a $\text{Vect}^{\text{gr},\text{gr}}$ -module category, where the second Vect^{gr} acts by forgetting the formal grading. By convention, we use X to denote the default grading and Y the extra grading we just introduced. We will also use the notation $\text{Vect}^{\text{gr}_X, \text{gr}_Y}$ if we want to make it clear which grading convention we are using.

In this subsection, unless otherwise specified, all the shearing and 2-periodization constructions will be with respect to the Y -grading even when we start with $\mathcal{C}^{\text{gr}} \in \text{Vect}^{\text{gr}_X} \text{-Mod}$, which has only *one* grading. In this case, we simply view \mathcal{C} as an object in $\text{Vect}^{\text{gr}_X, \text{gr}_Y} \text{-Mod}$ where $\text{Vect}^{\text{gr}_Y}$ acts via the symmetric monoidal functor $\text{oblv}_{\text{gr}_Y} : \text{Vect}^{\text{gr}_Y} \rightarrow \text{Vect}$. In particular, if we forget the $\text{Vect}^{\text{gr}_Y}$ -action, \mathcal{C}^{gr} , ${}^{\leftarrow}\mathcal{C}^{\text{gr}}$, and ${}^{\Rightarrow}\mathcal{C}^{\text{gr}}$ are equivalent as objects in $\text{Vect}^{\text{gr}_X} \text{-Mod}$ (and hence, also as DG-categories). The difference in the $\text{Vect}^{\text{gr}_Y}$ -module structures can be seen by looking at $\text{Vect}^{\text{gr}_X, \text{gr}_Y}$ -enriched Hom, denoted by $\mathcal{H}\text{om}^{\text{gr}_X, \text{gr}_Y}$.

More precisely, for $c_1, c_2 \in \mathcal{C}^{\text{gr}}$, on the one hand, we have

$$\mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X, \text{gr}_Y}(c_1, c_2) \simeq \bigoplus_k \mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X}(c_1, c_2)\langle k \rangle_Y \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}] \otimes \mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X}(c_1, c_2) \in \text{Vect}^{\text{gr}_X, \text{gr}_Y}.$$

Here, in the tensor formula, the gr_X -enriched Hom's are put in Y -degree 0. In other words, it is simply copies of the $\text{Vect}^{\text{gr}_X}$ -enriched Hom, put in all Y -degrees. On the other hand, a simple argument using adjunctions gives the following identification, which is essentially the same as Proposition 4.3.16 but with one extra grading (see also Remark 4.3.17).

Lemma 4.4.2. *In the situation above, we have natural equivalences*

$$\mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X, \text{gr}_Y}(c_1, c_2) \simeq \text{sh}^{\Rightarrow}(\mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X, \text{gr}_Y}(c_1, c_2)) \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\Rightarrow} \otimes \mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X}(c_1, c_2) \in \text{Vect}^{\text{gr}_X, \text{gr}_Y, \text{per}_+}$$

and

$$\mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X, \text{gr}_Y}(c_1, c_2) \simeq \text{sh}^{\leftarrow}(\mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X, \text{gr}_Y}(c_1, c_2)) \simeq \overline{\mathbb{Q}}_\ell[u, u^{-1}]^{\leftarrow} \otimes \mathcal{H}\text{om}_{\mathcal{C}^{\text{gr}}}^{\text{gr}_X}(c_1, c_2) \in \text{Vect}^{\text{gr}_X, \text{gr}_Y, \text{per}_-},$$

where sh^{\Rightarrow} and sh^{\leftarrow} are with respect to the Y -grading. Moreover, in the tensor formula, the gr_X -enriched Hom's are put in Y -degree 0.

4.4.3. The algebra \mathcal{B}_n and variants. Let $\mathcal{B}_n^{\text{gr}} = \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}] \otimes \overline{\mathbb{Q}}_\ell[S_n] \in \text{Alg}(\text{Vect}^{\text{gr}_X, \text{gr}_Y})$ be a bi-graded DG-algebra, where the variables \underline{x} (resp. \underline{y}) live in cohomological degree 2 (resp. 0) and graded degrees (2, 1) (resp. (-2, 0)). Here, the first (resp. second) coordinate represents the X -(resp. Y -)grading. Note that the Y -grading is the extra grading whereas the X -grading came from the above.

By construction, we have an equivalence of (singly graded) DG-algebras $\text{oblv}_{\text{gr}_Y}(\mathcal{B}_n^{\text{gr}}) \simeq \mathcal{B}_n \in \text{Alg}(\text{Vect}^{\text{gr}_X})$, where \mathcal{B}_n is the graded DG-algebra defined in §4.1.4. Let $\tilde{\mathcal{B}}_n^{\text{gr}} := \mathcal{B}_n^{\text{gr}, \leftarrow}$ and $\tilde{\mathcal{B}}_n := \text{oblv}_{\text{gr}_Y}(\tilde{\mathcal{B}}_n^{\text{gr}})$, where the shear is with respect to the Y -grading. Then,

$$\tilde{\mathcal{B}}_n^{\text{gr}} \simeq \overline{\mathbb{Q}}_\ell[\tilde{\underline{x}}, \tilde{\underline{y}}] \otimes \overline{\mathbb{Q}}_\ell[S_n] \in \text{Alg}(\text{Vect}^{\text{gr}_X, \text{gr}_Y})$$

where the variables $\tilde{\underline{x}}$ (resp. $\tilde{\underline{y}}$) live in cohomological degree 0 and graded degrees (2, 1) (resp. (-2, 0)). Moreover,

$$\tilde{\mathcal{B}}_n := \text{oblv}_{\text{gr}_Y}(\mathcal{B}_n^{\text{gr}}) \simeq \overline{\mathbb{Q}}_\ell[\tilde{\underline{x}}, \tilde{\underline{y}}] \otimes \overline{\mathbb{Q}}_\ell[S_n] \in \text{Alg}(\text{Vect}^{\text{gr}_X}),$$

where $\tilde{\underline{x}}$ (resp. $\tilde{\underline{y}}$) live in cohomological degree 0 and graded degree 2 (resp. -2).

Lemma 4.4.4. *We have the following equivalence of $\text{Vect}^{\text{gr}_X}$ -categories*

$$\mathcal{B}_n \text{-Mod}^{\text{gr}_X} \simeq \tilde{\mathcal{B}}_n^{\text{gr}} \text{-Mod}^{\text{gr}_X, \Rightarrow}.$$

Proof. We have

$$\mathcal{B}_n \simeq \text{oblv}_{\text{gr}_Y}(\mathcal{B}_n^{\text{gr}}) \simeq \text{oblv}_{\text{gr}_Y}(\tilde{\mathcal{B}}_n^{\text{gr}, \Rightarrow})$$

and hence, by (4.3.12), we have the following equivalence of $\text{Vect}^{\text{gr}_X}$ -module categories

$$\mathcal{B}_n \text{-Mod}^{\text{gr}_X} \simeq \text{oblv}_{\text{gr}_Y}(\tilde{\mathcal{B}}_n^{\text{gr}, \Rightarrow}) \text{-Mod}^{\text{gr}_X} \simeq \tilde{\mathcal{B}}_n^{\text{gr}} \text{-Mod}^{\text{gr}_X, \Rightarrow}$$

where, by convention, all shears are with respect to the Y -grading. □

Corollary 4.4.5. *We have a natural equivalence of $\text{Vect}^{\text{gr}_X, \text{gr}_Y}$ -module categories*

$$\Rightarrow (\mathcal{B}_n\text{-Mod}^{\text{gr}_X}) \simeq \widetilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_X, \text{gr}_Y, \text{per}_-},$$

where the $\text{Vect}^{\text{gr}_Y}$ -module structure on the right-hand side is the obvious one. Moreover, the shear on the left-hand side is with respect to the $\text{Vect}^{\text{gr}_Y}$ -module structure. Namely, $\text{Vect}^{\text{gr}_Y}$ acts on the left via

$$\text{Vect}^{\text{gr}_Y} \xrightarrow{\text{sh}^\Leftarrow} \text{Vect}^{\text{gr}_Y} \xrightarrow{\text{oblv}_{\text{gr}_Y}} \text{Vect},$$

as in Proposition 4.3.16. Consequently, by Remark 4.3.17, the equivalence above is an equivalence of $\text{Vect}^{\text{gr}_X, \text{gr}_Y, \text{per}_-}$ -module categories, where per_- is with respect to the Y -grading.

Proof. We have

$$\Rightarrow (\mathcal{B}_n\text{-Mod}^{\text{gr}_X}) \simeq \Rightarrow (\widetilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_X, \Rightarrow}) \simeq \widetilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_X, \text{gr}_Y, \text{per}_-},$$

where the first and second equivalences are due to Lemma 4.4.4 and Proposition 4.3.16, respectively. By convention, shearing and 2-periodization are with respect to the Y -grading.

The last statement is due to Remark 4.3.17. \square

4.4.6. *Change of gradings.* The gradings X and Y used above need to be changed to match with the one used in [GKS]. We denote the the new gradings \tilde{X} and \tilde{Y} where

$$\tilde{X} = X^2Y \quad \text{and} \quad \tilde{Y} = X^{-1}$$

or equivalently,

$$X = \tilde{Y}^{-1} \quad \text{and} \quad Y = \tilde{X}\tilde{Y}^2.$$

Under this change of gradings, we have

$$\widetilde{\mathcal{B}}_n^{\text{gr}} \simeq \overline{\mathbb{Q}}_\ell[\tilde{x}, \tilde{y}] \otimes \overline{\mathbb{Q}}_\ell[S_n] \in \text{Alg}(\text{Vect}^{\text{gr}_{\tilde{X}}, \text{gr}_{\tilde{Y}}}),$$

where the variables \tilde{x} (resp. \tilde{y}) live in cohomological degree 0 and graded degrees (1, 0) (resp. (0, 2)). We note that this algebra matches precisely with the algebra appearing in Proposition 4.2.7.

Remark 4.4.7. In the rest of this paper, unless otherwise specified, all the shears and 2-periodizations are still with respect to the Y -grading (in the X, Y -grading system), even when we are working with the \tilde{X}, \tilde{Y} -grading. As different grading conventions in the HOMFLY-PT homology theory cause a lot of confusion, at least, to the authors of the current paper, we write down explicit examples below.

4.4.8. *per₋ in terms of \tilde{X}, \tilde{Y} -grading.* In terms of the \tilde{X}, \tilde{Y} -grading, negative periodization per_- in the Y -direction with respect to the X, Y -grading (such as the one appearing in Corollary 4.4.5) takes the following form. For $\mathcal{C} \in \text{Vect}^{\text{gr}_X, \text{gr}_Y}\text{-Mod} \simeq \text{Vect}^{\text{gr}_{\tilde{X}}, \text{gr}_{\tilde{Y}}}\text{-Mod}$,

$$\mathcal{C}^{\text{per}_-} \simeq \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}(\mathcal{C}),$$

where β lives in cohomological degree -2 and graded degrees (0, 1) in terms of the X, Y -grading or equivalently, (1, 2) in terms of the \tilde{X}, \tilde{Y} -grading. Since this is the only 2-periodization that we will use in connection to the \tilde{X}, \tilde{Y} -grading, we will adopt the following notation in the rest of the paper

$$\mathcal{C}^{\text{per}} := \mathcal{C}^{\text{per}_-} \simeq \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}(\mathcal{C}),$$

where, as above, β lives in cohomological degree -2 and graded degrees (0, 1) in terms of the X, Y -grading or, equivalently, (1, 2) in terms of the \tilde{X}, \tilde{Y} -grading.

Below are a couple of examples that are important to us.

Definition 4.4.9 (2-periodizing an object). For $\mathcal{C} \in \text{Vect}^{\text{gr}_X, \text{gr}_Y}\text{-Mod} \simeq \text{Vect}^{\text{gr}_{\tilde{X}}, \text{gr}_{\tilde{Y}}}\text{-Mod}$ and $c \in \mathcal{C}$, the corresponding 2-periodized object $c^{\text{per}} \in \mathcal{C}^{\text{per}}$ is defined to be $\overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}] \otimes c$.

Definition 4.4.10 (2-periodized Hilbert schemes). Let \mathbb{G}_m^2 act on \mathbb{A}^2 by scaling the coordinate axes \tilde{x} and \tilde{y} with weights (1, 0) and (0, 2), respectively (in the \tilde{X}, \tilde{Y} -grading). This induces an action of \mathbb{G}_m^2 on $\text{Hilb}_n := \text{Hilb}_n(\mathbb{A}^2)$ for any n . The 2-periodized category of quasi-coherent sheaves on Hilb_n is defined to be

$$\text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}} := \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}(\text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2))$$

where β lives in cohomological degree -2 and bi-graded degrees $(1, 2)$. Taking the compact objects, we define²³

$$\text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}} := (\overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}(\text{QCoh}(\text{Hilb}_n / \mathbb{G}_m)))^{\text{perf}}.$$

The full subcategories $\text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n,\tilde{x}} / \mathbb{G}_m^2}$ and $\text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n,\tilde{x}} / \mathbb{G}_m^2}$ are defined analogously (see also §4.2.9).

Definition 4.4.11 (2-periodized bi-graded chain complexes). We define

$$\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}} := \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}}$$

where β lives in cohomological degree -2 and bi-graded degrees $(1, 2)$. The full subcategory spanned by compact objects is defined analogously and is denoted by

$$\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}, c} := \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{perf}}.$$

More generally, for any algebra $\mathcal{B} \in \text{Alg}(\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}})$, we let

$$\mathcal{B}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}} := \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}(\mathcal{B}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}}),$$

and similarly for the full subcategory spanned by the compact objects

$$\mathcal{B}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}, \text{perf}} := \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}(\mathcal{B}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{perf}}).$$

4.4.12. Shearing in terms of \tilde{X}, \tilde{Y} -grading. Let $\mathcal{C} \in \text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}}\text{-Mod} \simeq \text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}}\text{-Mod}$. Then, unless otherwise specified, all shears are considered to be with respect to the Y -grading. For example, the action of $\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}}$ on $\Rightarrow \mathcal{C}$ is given by

$$\overline{\mathbb{Q}}_\ell\langle k \rangle_{\tilde{X}} \boxtimes \overline{\mathbb{Q}}_\ell\langle l \rangle_{\tilde{Y}} \boxtimes c \mapsto \overline{\mathbb{Q}}_\ell\langle 2k - l \rangle_X \boxtimes \overline{\mathbb{Q}}_\ell\langle k \rangle_Y \boxtimes c \mapsto c\langle 2k - l \rangle_X \langle k \rangle_Y [2k].$$

Here $c\langle m \rangle_X$ denotes the result obtained by $\overline{\mathbb{Q}}_\ell\langle m \rangle_X$ acting on c (and similarly for $c\langle m \rangle_Y$). Moreover, the square bracket denotes cohomological shift, which appears here due to the shear.

By Remark 4.3.17, $\Rightarrow \mathcal{C}$ is equipped with a natural action of $\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}$ (see Definition 4.4.11).

4.4.13. Hilbert scheme of points and graded unipotent character sheaves. The relation between Hilbert schemes of points and graded unipotent character sheaves can now be deduced in a straightforward way from the discussion above.

We start with a 2-periodized form of Proposition 4.2.7.

Lemma 4.4.14. *We have the following equivalences of $\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}$ -module categories*

$$\text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}} \simeq \tilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}} \quad \text{and} \quad \text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n,\tilde{x}}} \simeq \tilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}_{\text{nilp}_{\tilde{y}}},$$

and similarly for the full subcategories of perfect complexes.

Proof. The second equivalence follows from the first. The first one follows from applying the 2-periodization construction per described in §4.4.8 to Proposition 4.2.7. \square

Theorem 4.4.15. *When $G = \text{GL}_n$, we have the following equivalence of $\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}$ -module categories*

$$\Rightarrow \text{Ch}_G^{\text{u,gr,ren}} \simeq \tilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}_{\text{nilp}_{\tilde{y}}} \xrightarrow{\Psi^{\text{per}}} \text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n,\tilde{x}}}.$$

And similarly, we have the small variant, which is an equivalence of $\text{Vect}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}, c}$ -module categories

$$\Rightarrow \text{Ch}_G^{\text{u,gr}} \simeq \tilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}_{\text{nilp}_{\tilde{y}}} \xrightarrow{\Psi^{\text{per}}} \text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n,\tilde{x}}}.$$

Proof. The second statement follows from the first one by taking the full subcategories spanned by compact objects. For the first one, we have

$$\Rightarrow \text{Ch}_G^{\text{u,gr,ren}} \simeq (\mathcal{B}_n\text{-Mod}^{\text{gr}_{\tilde{x}}})_{\text{nilp}_{\tilde{y}}} \simeq \tilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}}_{\text{nilp}_{\tilde{y}}} \simeq \tilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}^{\text{gr}_{\tilde{x}}, \text{gr}_{\tilde{y}}, \text{per}} \simeq \text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n,\tilde{x}}},$$

where

- the first equivalence is due to Proposition 4.1.11 (after adding a sheared action of $\text{Vect}^{\text{gr}_{\tilde{y}}}$);

²³Note that since the Hilbert scheme is smooth, we could replace Perf by Coh.

- the second equivalence is due to Corollary 4.4.5;
- the third equivalence is by definition (see also §4.4.8);
- and finally, the last equivalence is due to Lemma 4.4.14.

□

4.5. Matching objects. Let \mathcal{T} denote the tautological bundle over Hilb_n . By abuse of notation, we will also use the same symbol to denote its equivariant version, i.e., a vector bundle of rank n over $\text{Hilb}_n/\mathbb{G}_m^2$. We will now match its exterior powers $\wedge^a \mathcal{T}$ under the equivalences of categories stated in Proposition 4.2.7 and Lemma 4.4.14. This subsection is merely a recollection of the results proved in [Kb], stated in our notation.

4.5.1. Exterior powers of the permutation representation. Let $T \in \widetilde{\mathcal{B}}_n\text{-Mod}^{\text{gr}_{\widetilde{X}}, \text{gr}_{\widetilde{Y}}} \simeq \text{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2))$ denote the tensor of the structure sheaf with the permutation representation. More explicitly,

$$T := \overline{\mathbb{Q}}_\ell[\widetilde{X}, \widetilde{Y}] \otimes P \in \widetilde{\mathcal{B}}_n\text{-Mod}^{\text{gr}_{\widetilde{X}}, \text{gr}_{\widetilde{Y}}},$$

where $P \in \text{Rep } S_n$ is the permutation representation. More geometrically, if we let

$$p : \mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2) \rightarrow B(S_n \times \mathbb{G}_m^2),$$

then $T := p^*(P)$, where $P \in \text{QCoh}(B(S_n \times \mathbb{G}_m^2))$ is the permutation of S_n put in bi-graded degrees $(0, 0)$ and cohomological degree 0. More generally, we have $\wedge^a T \simeq p^*(\wedge^a P)$.

We have the following elementary lemma.

Lemma 4.5.2. *For any $0 \leq a \leq n$, we have a natural isomorphism of S_n -representations*

$$\text{Ind}_{S_a \times S_{n-a}}^{S_n} (\text{sign}_a \boxtimes \text{triv}_{n-a}) \simeq \wedge^a P,$$

where sign_a is the sign representation of S_a and triv_{n-a} is the 1-dimensional trivial representation of S_{n-a} .

Proof. Let v_1, \dots, v_n be a natural basis of P as the permutation representation of S_n and v a basis of $\text{sign}_a \boxtimes \text{triv}_{n-a}$. We have a natural morphism between $S_a \times S_{n-a}$ -representations

$$\begin{aligned} \text{sign}_a \boxtimes \text{triv}_{n-a} &\rightarrow \wedge^a P \\ v &\mapsto v_1 \wedge \dots \wedge v_a. \end{aligned}$$

Since $v_1 \wedge \dots \wedge v_a$ generates $\wedge^a P$ as a representation of S_n , we obtain a surjective map

$$\text{Ind}_{S_a \times S_{n-a}}^{S_n} (\text{sign}_a \boxtimes \text{triv}_{n-a}) \rightarrow \wedge^a P.$$

Comparing the dimensions, we see that this must be an isomorphism. □

4.5.3. Wedges of the tautological bundle and wedges of the permutation representation. We will now match the wedges on both sides.

Theorem 4.5.4 ([Kb, Theorem 3.9]). *Under the equivalence of categories stated in Proposition 4.2.7, $\wedge^a T \in \widetilde{\mathcal{B}}_n\text{-Mod}^{\text{gr}_{\widetilde{X}}, \text{gr}_{\widetilde{Y}}} \simeq \text{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2))$ corresponds to $\wedge^a \mathcal{T} \in \text{QCoh}(\text{Hilb}_n/\mathbb{G}_m^2)$.*

Proof. This is [Kb, Theorem 3.9] in the case where the line bundle involved is just the structure sheaf. Lemma 4.5.2 allows us to match the wedges $\wedge^a T$ with the $W^a(-)$ construction in [Kb, Definition 3.4]. □

4.5.5. 2-periodization. We will need the 2-periodized version of Theorem 4.5.4 below.

Corollary 4.5.6. *Under the equivalence of categories stated in Lemma 4.4.14,*

$$(\wedge^a T)^{\text{per}} \in \widetilde{\mathcal{B}}_n\text{-Mod}^{\text{gr}_{\widetilde{X}}, \text{gr}_{\widetilde{Y}}, \text{per}} \simeq \text{QCoh}(\mathbb{A}^{2n}/(S_n \times \mathbb{G}_m^2))^{\text{per}}$$

corresponds to $(\wedge^a \mathcal{T})^{\text{per}} \in \text{QCoh}(\text{Hilb}_n/\mathbb{G}_m^2)^{\text{per}}$. Here, the superscript per denote the procedure of 2-periodizing an object (see Definition 4.4.9).

Proof. This follows from 2-periodizing Theorem 4.5.4. □

5. HOMFLY-PT HOMOLOGY VIA HILBERT SCHEMES OF POINTS ON \mathbb{C}^2

We will now use the results above to obtain a proof of a conjecture of Gorsky–Neguț–Rasmussen [GNR] which predicts a remarkable way to realize HOMFLY-PT homology as the cohomology of a certain coherent sheaf on the Hilbert scheme of points on \mathbb{C}^2 . This conjecture also appeared as [GKS, Conjecture 7.2], which is the version we will work with. In particular, we will prove parts (a), (b), and (c) of [GKS, Conjecture 7.2].

Below, in §5.1, we use weight structures to describe a general mechanism to turn a cohomological grading into a formal grading and interpret the construction of the HOMFLY-PT homology theory in these terms (this is what happens with the a -degree). It is followed by §5.2, where we describe how HOMFLY-PT can be obtained from the categorical trace of H_n^{gr} . In §5.3, we explicitly compute all the functors involved in the factorization of HOMFLY-PT homology through the categorical trace of H_n^{gr} in terms of the explicit description of the category of the latter, which was obtained in Theorem 3.3.4. In §5.4, transporting these computations to the Hilbert scheme side using Koszul duality and Krug’s result (which are encapsulated in §4), we arrive at Theorem 5.4.6 (which is part (a) of [GKS, Conjecture 7.2]) which associates to each braid β on n strands a (2-periodic) coherent sheaf \mathcal{F}_β on Hilb_n whose global sections (after being tensored by the dual of various exterior powers of the tautological bundle) recover the HOMFLY-PT homology of the link associated by β . Finally, in §§5.5 & 5.6 we study the actions of symmetric functions on HOMFLY-PT homology and the support of \mathcal{F}_β on Hilb_n in relation to the number of connected components the braid closure of β has. These appear as Theorems 5.5.1 and 5.6.4, which are parts (b) and (c) of [GKS, Conjecture 7.2].

5.1. Restricting to and extending from the weight heart. Let $R_\beta \in \text{Ch}^b(\text{SBim}_n)$ be the Rouquier complex associated to a braid β . Recall that the HOMFLY-PT homology of the associated braid closure of β is obtained by taking Hochschild homology *term-wise* and then taking the cohomology of the resulting complexes. The final answer thus has *three* gradings: internal grading, complex grading (from $\text{Ch}^b(\text{SBim}_n)$), and the Hochschild grading. From the point of view of homological algebra, this is quite unusual: one does not normally apply a derived functor term-wise to a complex. Moreover, it is also unusual because the description of the HOMFLY-PT homology in terms of Hilbert schemes of points on \mathbb{C}^2 according to the conjecture of Gorsky–Neguț–Rasmussen [GNR; GKS] does not involve any such procedure.

There have been many interpretations of this construction, for example, [WWb; T; BT]. In this subsection, we offer a general paradigm to understand this type of construction, using weight structures and then apply it to the case of HOMFLY-PT homology. This allows one to see more clearly what is happening conceptually, especially on the Koszul dual side, which will be discussed in §5.4 below.

As we will use weight structures in a crucial way, the reader might find it beneficial to take a quick look at [HLb, §5.1] for a quick review of the theory.

5.1.1. Extending from the weight heart. One salient feature of the theory of weights is that given an idempotent complete stable ∞ -category \mathcal{C} with a bounded weight structure, the category \mathcal{C} along with the weight structure can be reconstructed from its weight heart $\mathcal{C}^{\heartsuit_w}$.²⁴ In a precise sense, \mathcal{C} is the free stable ∞ -category generated by its weight heart. Namely, $\mathcal{C} \simeq (\mathcal{C}^{\heartsuit_w})^{\text{fin}}$, where for any additive category \mathcal{A} , \mathcal{A}^{fin} is the stabilization of the sifted-completion of \mathcal{A} (see [ESb] for more details). We note that the $(-)^{\text{fin}}$ procedure generalizes the construction $\text{Ch}^b(-)$ in the following sense: if \mathcal{A} is a classical additive category, then $\mathcal{A}^{\text{fin}} \simeq \text{Ch}^b(\mathcal{A})$.

Lemma 5.1.2. *Let \mathcal{C} and \mathcal{D} be idempotent complete stable ∞ -categories such that \mathcal{C} is equipped with a bounded weight structure. Then, restricting along $\iota : \mathcal{C}^{\heartsuit_w} \rightarrow \mathcal{C}$ gives an equivalence of categories*

$$(5.1.3) \quad \text{Fun}^{\text{ex}}(\mathcal{C}, \mathcal{D}) \xrightarrow{\iota^!} \text{Fun}^{\text{add}}(\mathcal{C}^{\heartsuit_w}, \mathcal{D}),$$

²⁴A DG-structure is not necessary for this discussion in this subsection. However, the reader should feel free to replace all occurrences of stable ∞ -categories with DG-categories if they prefer.

where Fun^{ex} denotes the category of exact functors (i.e., those that preserve all finite (co)limits) and Fun^{add} denotes the category of additive functors (i.e., those that preserve all finite direct sums).

Proof. This is essentially [S, Proposition 3.3, part 2] (but see also [ESb, Theorem 2.2.9] for a variant). We will thus only indicate the main steps.

We will first show the following equivalence of categories

$$(5.1.4) \quad \text{Fun}^{\text{ex}}(\mathcal{C}, \text{Ind}(\mathcal{D})) \xrightarrow{\iota^!} \text{Fun}^{\text{add}}(\mathcal{C}^{\heartsuit_w}, \text{Ind}(\mathcal{D})),$$

where $\text{Ind}(\mathcal{D})$ is the Ind-completion of \mathcal{D} . $\iota^!$ admits a left adjoint $\iota_!$ given by left Kan extending along ι . Since left Kan extending along a fully faithful embedding is fully faithful, we see that $\iota_!$ is fully faithful. It remains to show that the $\iota^!$ is also fully faithful. Namely, we want to show that the natural map $\iota_! \iota^! F \rightarrow F$ is an equivalence for any $F \in \text{Fun}^{\text{ex}}(\mathcal{C}, \mathcal{D})$.

Since $\iota^! \iota_! \iota^! F \simeq \iota^! F$ by full faithfulness of $\iota_!$, we see that $\iota_! \iota^! F(c) \simeq F(c)$ for all $c \in \mathcal{C}^{\heartsuit_w}$. But since both sides of $\iota_! \iota^! F \rightarrow F$ preserve all finite (co)limits and since \mathcal{C} is generated by $\mathcal{C}^{\heartsuit_w}$ under finite (co)limits, we are done.

To obtain (5.1.3) from (5.1.4) we only need to show that $\iota^!$ and $\iota_!$ restrict to the corresponding full subcategories on both sides. But this is immediate using the fact that \mathcal{C} is generated by $\mathcal{C}^{\heartsuit_w}$ under finite (co)limits. \square

We will also need the following result, which is a consequence of the lemma above.

Corollary 5.1.5 ([ESb, Theorem 2.2.9]). *Let \mathcal{C} and \mathcal{D} be idempotent complete stable ∞ -categories such that both \mathcal{C} and \mathcal{D} are each equipped with a bounded weight structure. Then, restricting along $\iota : \mathcal{C}^{\heartsuit_w} \rightarrow \mathcal{C}$ gives an equivalence of categories*

$$\text{Fun}^{\text{ex}, w\text{-ex}}(\mathcal{C}, \mathcal{D}) \xrightarrow{\iota^!} \text{Fun}^{\text{add}}(\mathcal{C}^{\heartsuit_w}, \mathcal{D}^{\heartsuit_w}),$$

where $w\text{-ex}$ denotes weight exactness, i.e., we consider the category of exact functors which send weight heart to weight heart.

Consequently, when $\mathcal{D}^{\heartsuit_w}$ is classical, we have the following equivalences,

$$\text{Fun}^{\text{ex}, w\text{-ex}}(\mathcal{C}, \mathcal{D}) \simeq \text{Fun}^{\text{add}}(\mathcal{C}^{\heartsuit_w}, \mathcal{D}^{\heartsuit_w}) \simeq \text{Fun}^{\text{add}}(\text{h}\mathcal{C}^{\heartsuit_w}, \mathcal{D}^{\heartsuit_w}) \simeq \text{Fun}^{\text{ex}, w\text{-ex}}(\text{Ch}^b(\text{h}\mathcal{C}^{\heartsuit_w}), \mathcal{D}).$$

5.1.6. Turning cohomological grading into a formal grading. In situations where \mathcal{D} also has a t -structure, the procedure of restricting and extending along $\mathcal{C}^{\heartsuit_w} \hookrightarrow \mathcal{C}$ also allows one to create an extra grading. Indeed, let \mathcal{C} and \mathcal{D} be as in Lemma 5.1.2 and $F : \mathcal{C} \rightarrow \mathcal{D}$ be an exact functor. Suppose that \mathcal{D} is equipped with a t -structure. Then, we obtain a functor

$$\text{H}^*(F|_{\mathcal{C}^{\heartsuit_w}}) : \mathcal{C}^{\heartsuit_w} \xrightarrow{F|_{\mathcal{C}^{\heartsuit_w}}} \mathcal{D} \xrightarrow{\text{H}^*} \mathcal{D}^{\heartsuit_t, \text{gr}},$$

where $\mathcal{D}^{\heartsuit_t, \text{gr}}$ is the category of \mathbb{Z} -graded objects in $\mathcal{D}^{\heartsuit_t}$. Applying the $(-)^{\text{fin}}$ construction and using Corollary 5.1.5, we obtain a functor

$$\tilde{F} : \mathcal{C} \rightarrow (\mathcal{D}^{\heartsuit_t, \text{gr}})^{\text{fin}} \simeq \text{Ch}^b(\mathcal{D}^{\heartsuit_t, \text{gr}}) \rightarrow \text{Ch}^b(\mathcal{D}^{\heartsuit_t})^{\text{gr}}.$$

where the equivalence is due to the fact that $\mathcal{D}^{\heartsuit_t, \text{gr}}$ is classical, i.e., it does not have negative Ext's. In fact, since $\mathcal{D}^{\heartsuit_t, \text{gr}}$ is classical, $\mathcal{C}^{\heartsuit_w} \rightarrow \mathcal{D}^{\heartsuit_t, \text{gr}}$ factors through $\mathcal{C}^{\heartsuit_w} \rightarrow \text{h}\mathcal{C}^{\heartsuit_w}$ and hence, \tilde{F} factors as follows

$$(5.1.7) \quad \begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \text{Ch}^b(\mathcal{D}^{\heartsuit_t})^{\text{gr}} \\ & \searrow \text{wt} & \nearrow \tilde{F} \\ & \text{Ch}^b(\text{h}\mathcal{C}^{\heartsuit_w}) & \end{array}$$

Here $\text{h}\mathcal{C}^{\heartsuit_w}$ is the homotopy category of $\mathcal{C}^{\heartsuit_w}$, obtained from $\mathcal{C}^{\heartsuit_w}$ by killing negative Ext's,²⁵ and wt denotes the weight complex functor (see [HLb, Remark 5.1.12] for a quick review). Note that $\text{h}\mathcal{C}^{\heartsuit_w}$ is

²⁵For an additive ∞ -category \mathcal{A} , the homotopy category $\text{h}\mathcal{A}$ of \mathcal{A} is obtained from \mathcal{A} by taking π_0 of the Hom spaces. This is not to be confused with the homotopy category $K^b(\mathcal{B}) := \text{hCh}^b(\mathcal{B})$ of bounded chain complexes of a (classical) additive category \mathcal{B} , which is also sometimes referred to as, somewhat confusingly, the homotopy category of \mathcal{B} .

always a classical category whereas $\mathcal{C}^{\heartsuit_w}$ might have non-trivial ∞ -categorical structures. Moreover, \tilde{F} is given by applying $H^*(F)$ term-wise.

5.1.8. When $\mathcal{C}^{\heartsuit_w}$ is already classical, i.e., $\mathcal{C}^{\heartsuit_w} \simeq h\mathcal{C}^{\heartsuit_w}$, the weight complex functor is an equivalence of categories

$$\text{wt} : \mathcal{C} \xrightarrow{\simeq} \text{Ch}^b(\mathcal{C}^{\heartsuit_w}).$$

Under this identification, the functor \tilde{F} is identified with \tilde{F} , which is given by applying $H^*(F)$ term-wise to the chain complexes in $\mathcal{C}^{\heartsuit_w}$.

5.1.9. The category \mathcal{D} that is of interest to us is $\mathcal{D} \simeq \text{Vect}^{\text{gr}}$. Given an exact functor $F : \mathcal{C} \rightarrow \text{Vect}^{\text{gr}}$, the construction above thus produces a functor $\tilde{F} : \mathcal{C} \rightarrow \text{Vect}^{\text{gr}, \text{gr}}$ whose target is the DG-category of chain complexes in doubly graded vector spaces. We can take cohomology another time and obtain triply graded vector spaces. As we will soon see, further specializing to the case where $\mathcal{C} = H_n^{\text{gr}} \simeq \text{Ch}^b(H_n^{\text{gr}, \heartsuit_w}) \simeq \text{Ch}^b(\text{SBim}_n)$ and F is the functor of taking Hochschild homology, we recover the usual construction of the triply graded HOMFLY-PT homology theory.

5.1.10. The last observation is a tautology, but a powerful one when combined with Lemma 5.1.2 which allows one to compare functors by restricting to the weight heart of the source. This point of view is especially useful when the weight structure is not evident, as is the case on the Hilbert scheme side. Indeed, as we shall see below, Lemma 5.1.2 allows us to identify HH_a and the functor co-represented by the a -th exterior of the tautological bundle on the Hilbert scheme.

5.2. **HOMFLY-PT homology via $\text{Tr}(H_n^{\text{gr}})$.** We will now describe how HOMFLY-PT homology can be obtained from $\text{Tr}(H_n^{\text{gr}}) \simeq \text{Ch}_G^{u, \text{gr}}$. Everything in this subsection has essentially been proved in [WWb], but in a different language: they use the chromatographic complex construction (which is not known to be functorial) of which the weight complex functor is a functorial upgrade. See also [STZ, §6.4] for a presentation that is closer to ours (but still does not use weight structures).

5.2.1. *A geometric interpretation of HOMFLY-PT homology.* We will start with a formulation of HOMFLY-PT homology in terms of graded sheaves on $BB \times_{BG} BB = B \backslash G/B$. Consider the following commutative diagram

$$\begin{array}{ccccc} BB \times_{BG} BB & \xleftarrow{p} & \frac{G}{B} & \xrightarrow{q} & \frac{G}{G} \longrightarrow \text{pt} \\ \downarrow \pi & & \downarrow \pi & & \\ BB \times BB & \xleftarrow{p} & BB & & \end{array}$$

where the square is Cartesian. We have the following functor

$$(5.2.2) \quad \text{HH} : H_n^{\text{gr}} \simeq \text{Shv}_{\text{gr}, c}(BB \times_{BG} BB) \xrightarrow{\pi_*} \text{Shv}_{\text{gr}, c}(BB \times BB) \xrightarrow{p^*} \text{Shv}_{\text{gr}, c}(BB) \xrightarrow{C_{\text{gr}}^*(BB, -)} \text{Vect}^{\text{gr}}.$$

Applying the construction in §5.1.6, we obtain a functor

$$\widetilde{\text{HH}} : H_n^{\text{gr}} \rightarrow \text{Vect}^{\text{gr}, \text{gr}}.$$

Taking cohomology one more time, we get

$$\text{HHH} := H^*(\widetilde{\text{HH}}) : H_n^{\text{gr}} \rightarrow \text{Vect}^{\heartsuit, \text{gr}, \text{gr}},$$

the category of triply graded vector spaces.

Lemma 5.2.3. *Let $R_\beta \in H_n^{\text{gr}}$ be associated to a braid β . Then up to a change of grading (to be discussed in §5.2.4 below), $H^*(\widetilde{\text{HH}}(R_\beta))$ is the triply graded HOMFLY-PT link homology of β .*

Proof (Sketch). This is the main theorem of [WWb], phrased in our language. See also [STZ, §6.4] for a presentation that is closer to ours. We will thus only indicate the main steps here.

The construction in §5.1.6 amounts to saying that $\widetilde{\text{HH}}(R_\beta)$ is obtained by applying $p^*\pi_*$ term-wise to $R_\beta \in H_n^{\text{gr}} \simeq \text{Ch}^b(H_n^{\text{gr}, \heartsuit_w})$. By [HLb, Proposition 6.3.5], we know that $\text{Shv}_{\text{gr}, c}(BB \times BB)$ (resp. $\text{Shv}_{\text{gr}, c}(BB)$) corresponds to the category of (perfect complexes of) graded bimodules (resp. modules)

over $C_{\text{gr}}^*(BB) \simeq C_{\text{gr}}^{\text{gr}}(BT) \simeq \text{Sym}(V[-2])$, where V is the graded vector space of dimension n living in graded degree 2 and cohomological degree 0 (see also §4.1.4). Moreover, by [HLb, §6.3.4], pulling back along $p : BB \rightarrow BB \times BB$ corresponds to taking Hochschild homology. Finally, by [HLb, (6.4.4)], $\pi_*|_{H_n^{\text{gr}, \mathcal{Q}_w}}$ is identified with the forgetful functor from Soergel bimodules to bimodules over $C_{\text{gr}}^{\text{gr}}(BB) \simeq C_{\text{gr}}^{\text{gr}}(BT)$. Thus, the proof concludes. \square

5.2.4. Gradings. We let Q' and A' denote the two formal gradings on $\text{Vect}^{\text{gr}, \text{gr}}$ (the target of the functor $\widetilde{\text{HH}}$) and T' the cohomological grading. To keep track of these gradings, we will, from now on, adopt the notation $\text{Vect}^{\text{gr}_{Q'}, \text{gr}_{A'}}$ rather than simply $\text{Vect}^{\text{gr}, \text{gr}}$ as above. We use $[n]_{Q'}$, $\langle n \rangle_{A'}$, and $\{n\}_{T'}$ to denote the grading shifts.

The relations between the Q' , A' , and T' gradings and the Q , A , and T of [GKS] are as follows (written multiplicatively)

$$Q' = A^{-1}Q, \quad A' = A, \quad T' = T.$$

Note, however, that [GKS] uses Hochschild *cohomology* rather than homology to define the HOMFLY-PT link homology. Thus, for the unknot we get $\frac{1+Q'^2A'}{1-Q'^2A'^2} = \frac{1+Q^2A^{-1}}{1-Q^2}$ whereas they get $\frac{1+Q^{-2}A}{1-Q^2}$.

We also use the q , t , and a gradings, where

$$q = Q^2 = Q'^2A'^2, \quad a = Q^2A^{-1} = Q'^2A', \quad t = T^2Q^{-2} = T'^2Q'^{-2}A'^{-2}.$$

In terms of q , a , and t , the unknot gives $\frac{1+a}{1-q}$.

5.2.5. On H_n^{gr} , $\text{Ch}_G^{\text{u,gr}} \simeq \mathcal{A}_n\text{-Mod}^{\text{gr}, \text{perf}}$, and $\mathcal{A}_n\text{-Mod}^{\text{gr}, \text{coh}}$ there are two grading shift operators for each $n \in \mathbb{Z}$, the cohomological shift $[n]$ and the grading shift $\langle n \rangle$, and both are all compatible with the various functors between these categories. In terms of the grading convention of §4.4, this formal grading is the X -grading over there.

5.2.6. Unwinding the construction, we see that the functor $\widetilde{\text{HH}}$ relates the grading shift operators on H_n^{gr} and those on $\text{Vect}^{\text{gr}_{Q'}, \text{gr}_{A'}}$ as follows²⁶

$$[n] \rightsquigarrow \{n\}_{T'}, \quad \langle n \rangle \rightsquigarrow [n]_{A'} \langle n \rangle_{Q'} \{-n\}_{T'}, \quad [n] \langle n \rangle \rightsquigarrow [n]_{A'} \langle n \rangle_{Q'}.$$

Remark 5.2.7. The difference between Q' , A' , T' and Q , A , T comes from the fact that the identification $H_n^{\text{gr}} := \text{Shv}_{\text{gr}, c}(B \setminus G/B) \simeq \text{Ch}^b(\text{SBim}_n)$ involves a shear. More concretely, objects in H_n^{gr} are most naturally viewed as graded $C_{\text{gr}}^*(BB)$ -bimodules, where the generators of $C_{\text{gr}}^*(BB) \simeq C_{\text{gr}}^*(BT) \simeq \text{Sym } V[-2]$ live in graded (resp. cohomological) degree 2 (resp. 2). On the other hand, the generators of the polynomial ring used to define Soergel bimodules are, by convention, put in graded (resp. cohomological) degrees 2 (resp. 0). See [HLb, §6] for a more in-depth discussion.

5.2.8. HOMFLY-PT homology via truncated categorical trace. By smooth base change, we see that the functor HH of (5.2.2) admits an alternative construction

$$\text{HH} : H_n^{\text{gr}} \simeq \text{Shv}_{\text{gr}, c}(BB \times_{BG} BB) \xrightarrow{p^*} \text{Shv}_{\text{gr}, c}\left(\frac{G}{B}\right) \xrightarrow{q_* \simeq q_!} \text{Shv}_{\text{gr}, c}\left(\frac{G}{G}\right) \xrightarrow{C_{\text{gr}}^*(G/G, -)} \text{Vect}^{\text{gr}},$$

which is the same as

$$(5.2.9) \quad \text{HH} : H_n^{\text{gr}} \xrightarrow{\text{tr}} \text{Tr}(H_n^{\text{gr}}) \simeq \text{Ch}_G^{\text{u,gr}} \hookrightarrow \text{Shv}_{\text{gr}, c}(G/G) \xrightarrow{C_{\text{gr}}^*(G/G, -)} \text{Vect}^{\text{gr}}.$$

Since the functor $\text{tr} : H_n^{\text{gr}} \rightarrow \text{Ch}_G^{\text{u,gr}}$ is weight exact, it commutes with the weight complex functors. Thus, to construct $\widetilde{\text{HH}}$ from HH , we can apply the construction at §5.1.6 to the last step of (5.2.9). As a

²⁶The first and last are easiest to see from the definition, from which the middle one could be deduced. Alternatively, the middle one can also be seen by looking at the weight complex functor.

result, we obtain the following factorization of \widehat{HH}

$$(5.2.10) \quad \begin{array}{ccccc} & & \widehat{HH} & & \\ & \nearrow & & \searrow & \\ H_n^{gr} & \xrightarrow{tr} & Ch_G^{u,gr} & \xrightarrow{\Gamma} & Vect^{gr_{Q'}, gr_{A'}} \\ & & \downarrow wt & \nearrow \bar{\Gamma} & \\ & & Ch^b(hCh_G^{u,gr, \heartsuit_w}) & & \end{array}$$

where Γ is obtained by applying the construction at §5.1.6 to the functor $C_{gr}^*(G/G, -)$ and $\bar{\Gamma}$ is the induced functor (see (5.1.7)). The category $Ch^b(hCh_G^{u,gr, \heartsuit_w})$ (resp. $hCh_G^{u,gr, \heartsuit_w}$) can be thought of as a truncation of $Ch_G^{u,gr}$ (resp. Ch^{u,gr, \heartsuit_w}), which justifies the name *truncated trace*. It is also referred to as the *underived trace* and is denoted by $Tr_0(H_G^{gr})$ in [GHW].

5.3. Explicit computation of functors. In what follows, we will compute the functors Γ , $\bar{\Gamma}$, and wt in (5.2.9) explicitly in terms of the identification

$$Ch_G^{u,gr} \simeq \overline{\mathbb{Q}}_\ell[x, \theta] \otimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{gr, perf} = \mathcal{A}_n\text{-Mod}^{gr, perf}$$

of Theorem 3.3.4. In particular, we apply Lemma 5.1.2 to deduce a co-representability statement similar to the main result of [BT; T].²⁷ Moreover, our computation identifies the weight complex functor wt with the functor of restricting to the nilpotent cone, explaining conceptually why the latter appears in [T]; see §5.3.5.

5.3.1. Identifying the weight complex functor wt for $Ch_G^{u,gr}$. We will now give a concrete interpretation of the functor wt appearing in (5.2.10) in terms of modules over \mathcal{A}_n . Consider the following functor

$$\widetilde{inv}_\theta := \text{Sym}^n V^\vee[1] \otimes inv_\theta : \mathcal{A}_n\text{-Mod}^{gr, perf} \rightarrow \overline{\mathcal{A}}_n\text{-Mod}^{gr, perf},$$

where inv_θ is defined in §4.1 and where we define

$$\overline{\mathcal{A}}_n := \overline{\mathbb{Q}}_\ell[x] \otimes \overline{\mathbb{Q}}_\ell[S_n] \simeq \text{Sym } V_x[-2] \otimes \overline{\mathbb{Q}}_\ell[S_n].$$

See also §4.1.4 for the definitions of V and \mathcal{A}_n .

Note that inv_θ is originally defined on $\mathcal{A}_n\text{-Mod}^{gr, coh}$. So strictly speaking, in the above, we restrict this functor to the full subcategory of perfect complexes. It is easy to see that \widetilde{inv}_θ is given precisely by applying $\widetilde{inv}_\theta^{enh}$ followed by the functor of forgetting the action by the variables y .

The goal now is to identify $wt : Ch_G^{u,gr} \rightarrow Ch^b(hCh_G^{u,gr, \heartsuit_w})$ with \widetilde{inv}_θ .

5.3.2. By Lemma 2.9.5, we see that in type A, $Ch_G^{u,gr} \simeq \mathcal{A}_n\text{-Mod}^{gr, perf}$ is equipped with a weight structure whose weight heart is spanned under finite direct sums of direct summands of $\text{Spr}_G^{gr}[k]\langle k \rangle$ (for all $k \in \mathbb{Z}$), which corresponds to $\mathcal{A}_n[k]\langle k \rangle$ (for all $k \in \mathbb{Z}$) under this equivalence of categories. Here, $[k]$ and $\langle k \rangle$ denote cohomological and grading shifts respectively.

A similar statement is true for $\overline{\mathcal{A}}_n\text{-Mod}^{gr, perf}$.

Lemma 5.3.3. *The category $\overline{\mathcal{A}}_n\text{-Mod}^{gr, perf}$ has a natural weight structure whose weight heart is spanned by finite direct sums of direct summands of $\overline{\mathcal{A}}_n[k]\langle k \rangle$ for all $k \in \mathbb{Z}$.*

Moreover, the weight heart $\overline{\mathcal{A}}_n\text{-Mod}^{gr, perf, \heartsuit_w}$ is classical and hence the weight complex functor induces an equivalence of categories

$$wt : \overline{\mathcal{A}}_n\text{-Mod}^{gr, perf} \xrightarrow{\simeq} Ch^b(\overline{\mathcal{A}}_n\text{-Mod}^{gr, perf, \heartsuit_w}).$$

Proof. It is easy to see that the direct summands of $\overline{\mathcal{A}}_n[k]\langle k \rangle$ generate the category under finite (co)limits. Moreover, as there are no positive Ext's between them, the weight structure is obtained invoking [Bb, Theorem 4.3.2.II]. The second part follows by observing that there are no negative Ext's between these objects either (see also [HLb, §5.1.9]). \square

²⁷It is in fact possible to reprove the co-representability statement of [BT] using the computation presented here. The details will appear in a forthcoming paper.

We are now ready to identify wt and $\widetilde{\text{inv}}_\theta$.

Proposition 5.3.4. *The functor $\widetilde{\text{inv}}_\theta$ induces an equivalence of categories $\overline{\text{inv}}_\theta$ as given in the following commutative diagram*

$$\begin{array}{ccc} \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} & \xrightarrow{\widetilde{\text{inv}}_\theta} & \overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}} \\ & \searrow \text{wt} \quad \nearrow \widetilde{\text{inv}}_\theta & \\ & \text{Ch}^b(\mathbf{h}\mathcal{A}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}) & \end{array}$$

Proof. The computation in §4.1.8 shows that $\widetilde{\text{inv}}_\theta(\mathcal{A}_n) \simeq \overline{\mathcal{A}}_n$ and hence, $\widetilde{\text{inv}}_\theta$ is weight exact. By Corollary 5.1.5, $\widetilde{\text{inv}}_\theta$ fits into the following commutative diagram

$$\begin{array}{ccc} \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} & \xrightarrow{\widetilde{\text{inv}}_\theta} & \overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}} \\ \downarrow \text{wt} & & \downarrow \text{wt} \\ \text{Ch}^b(\mathbf{h}\mathcal{A}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}) & \xrightarrow{\overline{\text{inv}}_\theta} & \text{Ch}^b(\overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}). \end{array}$$

It remains to show that $\overline{\text{inv}}_\theta$ is an equivalence of categories.

The diagram above is determined by the following commutative diagram involving the weight hearts

$$\begin{array}{ccc} \mathcal{A}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w} & \xrightarrow{\widetilde{\text{inv}}_\theta^{\heartsuit_w}} & \overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w} \\ \downarrow \pi_0 & & \parallel \\ \mathbf{h}\mathcal{A}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w} & \xrightarrow{\overline{\text{inv}}_\theta^{\heartsuit_w}} & \overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}. \end{array}$$

By Corollary 5.1.5, it suffices to show that $\overline{\text{inv}}_\theta^{\heartsuit_w}$ is an equivalence of categories. But this is clear since both

$$\mathcal{H}\text{om}_{\mathcal{A}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}}(\mathcal{A}_n, \mathcal{A}_n[k]\langle k \rangle) \rightarrow \mathcal{H}\text{om}_{\mathbf{h}\mathcal{A}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}}(\pi_0 \mathcal{A}_n, \pi_0 \mathcal{A}_n[k]\langle k \rangle)$$

and

$$\mathcal{H}\text{om}_{\overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}}(\overline{\mathcal{A}}_n, \overline{\mathcal{A}}_n[k]\langle k \rangle) \rightarrow \mathcal{H}\text{om}_{\mathbf{h}\overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf},\heartsuit_w}}(\pi_0 \overline{\mathcal{A}}_n, \pi_0 \overline{\mathcal{A}}_n[k]\langle k \rangle)$$

realize the RHS by killing off θ from the LHS. Thus, we are done. \square

5.3.5. Restricting to the nilpotent cone. The discussion above has a geometric interpretation in terms of character sheaves and sheaves on the nilpotent cone of G . It gives an explanation for why the nilpotent cone should appear at all in [T]. The materials presented here are of independent interest and are not needed anywhere else in the paper. We include them here mostly for the sake of completeness. The reader should feel free to skip to §5.3.11.

Let \mathcal{N} denote the nilpotent cone of the group $G = \text{GL}_n$, equipped with the conjugation action of G . Let $\iota_{\mathcal{N}} : \mathcal{N} \hookrightarrow G$ denote the closed embedding, then we have the following functor

$$\iota_{\mathcal{N}}^* : \text{Ch}_G^{\text{u,gr}} \rightarrow \text{Shv}_{\text{gr},c}(\mathcal{N}/G).$$

We let $\overline{\text{Spr}}_G^{\text{gr}} := \iota_{\mathcal{N}}^* \text{Spr}_G^{\text{gr}}$ denote the (graded) Springer sheaf.

The starting point is the following formality result of Rider, which was formulated in a different language.

Theorem 5.3.6 ([R, Theorem 7.9]). *The functor $\mathcal{H}\text{om}_{\text{Shv}_{\text{gr},c}(\mathcal{N}/G)}^{\text{gr}}(\overline{\text{Spr}}_G^{\text{gr}}, -)$ induces an equivalence of $\text{Vect}^{\text{gr},c}$ -categories*

$$\text{Shv}_{\text{gr},c}(\mathcal{N}/G) \simeq \mathcal{E}\text{nd}^{\text{gr}}(\overline{\text{Spr}}_G^{\text{gr}})\text{-Mod}^{\text{gr,perf}} \simeq \overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}.$$

The next input is a theorem of Trinh which compares the graded derived endomorphism rings of Spr_G^{gr} and $\overline{\text{Spr}}_G^{\text{gr}}$.

Theorem 5.3.7 ([T, Theorem 1]). *The morphism of algebras*

$$\mathcal{E}nd^{\text{gr}}(\text{Spr}_G^{\text{gr}}) \rightarrow \mathcal{E}nd^{\text{gr}}(\iota_N^* \text{Spr}_G^{\text{gr}}) \simeq \mathcal{E}nd^{\text{gr}}(\overline{\text{Spr}}_G^{\text{gr}})$$

identifies with the natural quotient $\mathcal{A}_n \rightarrow \overline{\mathcal{A}}_n$.

The following is thus a direct consequence of the two theorems above and Theorem 3.3.4.

Corollary 5.3.8. *We have a commutative diagram*

$$\begin{array}{ccc} \text{Ch}_G^{\text{u,gr}} & \xrightarrow{\iota_N^*} & \text{Shv}_{\text{gr},c}(\mathcal{N}/G) \\ \mathcal{H}om_{\text{Ch}_G^{\text{u,gr}}}(\text{Spr}_G^{\text{gr}}, -) \Big\downarrow \simeq & & \simeq \Big\downarrow \mathcal{H}om_{\text{Shv}_{\text{gr},c}(\mathcal{N}/G)}(\overline{\text{Spr}}_G^{\text{gr}}, -) \\ \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} & \xrightarrow{\widetilde{\text{inv}}_\theta} & \overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}. \end{array}$$

5.3.9. The category $\text{Shv}_{\text{gr},c}(\mathcal{N}/G)$ has a natural weight structure whose weight heart is spanned by finite direct sums of summands of $\overline{\text{Spr}}_G^{\text{gr}}[k]\langle k \rangle, k \in \mathbb{Z}$. This corresponds to the natural weight structure on $\overline{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}$ which is spanned by finite direct sums of summands of $\overline{\mathcal{A}}_n[k]\langle k \rangle, k \in \mathbb{Z}$. Since $\iota_N^*(\text{Spr}_G^{\text{gr}}) \simeq \overline{\text{Spr}}_G^{\text{gr}}, \iota_N^*$ is weight exact (as can also be seen at the level of $\widetilde{\text{inv}}_\theta$).

Proposition 5.3.10. *We have a commutative diagram*

$$\begin{array}{ccc} \text{Ch}_G^{\text{u,gr}} & \xrightarrow{\iota_N^*} & \text{Shv}_{\text{gr},c}(\mathcal{N}/G). \\ & \searrow \text{wt} & \nearrow \simeq \\ & \text{Ch}^b(\text{hCh}_G^{\text{u,gr}, \heartsuit_w}) & \end{array}$$

where all functors are weight-exact.

Proof. This follows directly from Corollary 5.3.8 and the identification of wt with $\widetilde{\text{inv}}_\theta$ in Proposition 5.3.4. \square

In [WWb], the HOMFLY-PT homology groups are constructed via the chromatographic complex construction, which is a triangulated (as opposed to DG) version of the weight complex functor (see also [HLb, Remark 5.1.12]). In [T], the HOMFLY-PT homology construction is then proved to factor through the nilpotent cone. Proposition 5.3.10 above puts these two results into context by identifying the weight complex functor itself and the functor ι_N^* of restricting to the nilpotent cone, explaining the reason why the nilpotent cone appears. Moreover, the equivalence $\text{hCh}_G^{\text{u,gr}, \heartsuit_w} \simeq \text{Shv}_{\text{gr},c}(\mathcal{N}/G)^{\heartsuit_w}$ realizes $\text{Shv}_{\text{gr},c}(\mathcal{N}/G)$ as the truncated trace of H_n^{gr} , as was speculated in [T].

5.3.11. *Identifying the functor $\overline{\Gamma}$.* We will now compute $\overline{\Gamma}$ appearing in (5.2.10) more explicitly: we decompose it into a direct sum (according to the a -degrees) of co-representable functors. In other words, the a -th piece captures the part of Γ that is a away from being pure.

For each integer a , consider

$$\tilde{\varphi}_a : \mathbb{Z} \rightarrow \mathbb{Z}^2$$

such that

$$\tilde{\varphi}_a(X) := \tau_a + \varphi(X) := (2a, a) + (X, X), \quad X \in \mathbb{Z}.$$

We define the associated functors $\tilde{\iota}_a, \iota_a : \text{Vect}^{\text{gr}} \rightarrow \text{Vect}^{\text{gr}_{Q', A'}}$ given by $\tilde{\varphi}_{a,*}$ and φ_* , both followed by a cohomological shear to the left whose amount is given by the X -degree. More precisely, for $(V_X)_{X \in \mathbb{Z}} \in \text{Vect}^{\text{gr}}$ (note that T' is the cohomological degree of $\text{Vect}^{\text{gr}_{Q', A'}}$, see §5.2.4),

$$\begin{aligned} \tilde{\iota}_a((V_X)_{X \in \mathbb{Z}})_{Q', A'} &= \begin{cases} V_X\{X\}_{T'}, & (Q', A') = \tilde{\varphi}_a(X), \\ 0, & \text{otherwise,} \end{cases} \\ \iota_a((V_X)_{X \in \mathbb{Z}})_{Q', A'} &= \begin{cases} V_X\{X\}_{T'}, & (Q', A') = \varphi(X), \\ 0, & \text{otherwise.} \end{cases} \end{aligned}$$

Note that the shear to the left by X is there to account for the fact that something in graded degree X and cohomological degree X in Vect^{gr} is sent to something of cohomological degree 0 when we apply the construction in §5.1.6 to turn a cohomological grading to a formal grading.

Proposition 5.3.12. *The functor $\bar{\Gamma} : \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \text{Vect}^{\text{gr}_{Q'}, \text{gr}_{A'}}$ breaks up into a finite direct sum*

$$\bar{\Gamma} \simeq \bigoplus_a \tilde{\iota}_a \left(\mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}}^{\text{gr}} (\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], -) \right),$$

where $P \in \text{Rep } S_n$ is the permutation representation.

Proof. By Lemma 5.1.2, $\bar{\Gamma}$ is determined by its restriction to the source's weight heart,

$$\bar{\Gamma}^{\heartsuit_w} : \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}, \heartsuit_w} \rightarrow \text{Vect}^{\heartsuit_t, \text{gr}_{Q'}, \text{gr}_{A'}} \rightarrow \text{Vect}^{\text{gr}_{Q'}, \text{gr}_{A'}}.$$

This functor, in turn, is determined by its action on $\bar{\mathcal{A}}_n$. Under the equivalence of categories in Theorem 3.3.4, the constant sheaf corresponds to $\bar{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}]$, from which we obtain the following natural equivalence

$$\begin{aligned} \bar{\Gamma}^{\heartsuit_w}(\bar{\mathcal{A}}_n) &\simeq \Gamma(\mathcal{A}_n) \simeq \bigoplus_a \tilde{\iota}_a (\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}]) \\ &\simeq \bigoplus_a \tilde{\iota}_a \left(\mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}, \heartsuit_w}}^{\text{gr}} (\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], \bar{\mathbb{Q}}_\ell[\underline{x}] \otimes \bar{\mathbb{Q}}_\ell[S_n]) \right) \\ &\simeq \bigoplus_a \tilde{\iota}_a \left(\mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}, \heartsuit_w}}^{\text{gr}} (\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], \bar{\mathcal{A}}_n) \right), \end{aligned}$$

where we have implicitly picked an isomorphism of S_n -representations $P \simeq P^\vee$. Moreover, the factor $(2a, a)$ in $\tilde{\varphi}_a$ is to account for the degrees of $\underline{\theta}$ in \mathcal{A}_n which are not there anymore in $\wedge^a P$: these are precisely the Q', A' -degrees of homogeneous wedges of $\underline{\theta}$ of order a . Thus, we have an equivalence of functors

$$\bar{\Gamma}^{\heartsuit_w} \simeq \bigoplus_a \tilde{\iota}_a \left(\mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}, \heartsuit_w}}^{\text{gr}} (\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], -) \right) : \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}, \heartsuit_w} \rightarrow \text{Vect}^{\heartsuit_t, \text{gr}_{Q'}, \text{gr}_{A'}}.$$

But now, the second functor has an extension to the whole of $\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}$, which is given by

$$\bigoplus_a \tilde{\iota}_a \left(\mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}}^{\text{gr}} (\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], -) \right) : \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \text{Vect}^{\text{gr}_{Q'}, \text{gr}_{A'}}.$$

The proof thus concludes by Lemma 5.1.2. □

Definition 5.3.13. We define

$$\begin{aligned} \bar{\Gamma}_a &:= \mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}}^{\text{gr}} (\bar{\mathbb{Q}}_\ell[\underline{x}] \otimes \wedge^a P, -) : \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \text{Vect}^{\text{gr}}, \\ \Gamma_a &:= \bar{\Gamma}_a \circ \text{wt} \simeq \bar{\Gamma}_a \circ \widetilde{\text{inv}}_\theta : \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \text{Vect}^{\text{gr}}, \\ \widetilde{\text{HH}}_a &:= \Gamma_a \circ \text{tr} : \text{H}_n^{\text{gr}} \rightarrow \text{Vect}^{\text{gr}}, \end{aligned}$$

Here, wt is the weight complex functor of $\text{Ch}_G^{\text{u,gr}} \simeq \mathcal{A}_n\text{-Mod}^{\text{gr,perf}}$, which is identified with $\widetilde{\text{inv}}_\theta$ by Proposition 5.3.4.

As a direct consequence of the direct sum decomposition of $\bar{\Gamma}$ in Proposition 5.3.12, we get the following direct sum decompositions of Γ and $\widetilde{\text{HH}}$.

Corollary 5.3.14. *We have the following equivalences of functors*

$$\bar{\Gamma} \simeq \bigoplus_a \tilde{\iota}_a \circ \bar{\Gamma}_a, \quad \Gamma \simeq \bigoplus_a \tilde{\iota}_a \circ \Gamma_a, \quad \text{and} \quad \widetilde{\text{HH}} \simeq \bigoplus_a \tilde{\iota}_a \circ \widetilde{\text{HH}}_a.$$

5.3.15. *Gradings.* By construction, for any integer a , $\tilde{\iota}_a$ sends an graded vector space of graded degree X and cohomological degree C to an object of Q', A', T' -degree $(X+2a, X+a, C-X)$. Written multiplicatively (see also §5.2.4), this object has degree

$$Q^{X+2a} A^{X+a} T^{C-X} = Q^{2a} A^a Q^X A^X T^{C-X} = a^a Q^X T^{C-X}.$$

Note that in a^a , the exponent is an integer, whereas the base is a formal variable used to keep track of the a -degrees. In other words, the target of $\tilde{\iota}_a$ has a -degree a . Consequently, $\tilde{\iota}_a \circ \bar{\Gamma}_a$, $\tilde{\iota}_a \circ \Gamma_a$, and $\tilde{\iota}_a \circ \widetilde{\text{HH}}_a$ all land in the a -degree a part. This justifies the notation given in Definition 5.3.13: $\bar{\Gamma}_a$, Γ_a , and $\widetilde{\text{HH}}_a$ are the a -degree a parts of $\bar{\Gamma}$, Γ , and $\widetilde{\text{HH}}$, respectively.

Observe that the factor $(2a, a)$ in $\tilde{\varphi}_a$ is responsible precisely for the a -degree. In what follows, we will treat each a -degree separately, and for each a -degree, we will ignore the a -factor and consider only the Q, T -degrees. Proposition 5.3.12 thus has the following reformulation.

Corollary 5.3.16. *The a -degree a part $\bar{\Gamma}_a$ of $\bar{\Gamma}$ is given by $\mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}}^{\text{gr}}(\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], -) \in \text{Vect}^{\text{gr}}$ where the degree (X, C) corresponds to $(X, C-X)$ in the Q, T -grading. Here, X is the graded degree and C is the cohomological degree in Vect^{gr} .*

5.3.17. *Identifying the functor Γ .* Our goal is now to show an analog of Corollary 5.3.16 for the functor Γ appearing in (5.2.10). We already saw in Corollary 5.3.14 above that Γ is decomposed into a direct sum of $\iota_a \circ \Gamma_a$. We will now show that Γ_a 's are co-representable, except that now, the co-representing objects live in $\mathcal{A}_n\text{-Mod}^{\text{gr,coh}} \subseteq \mathcal{A}_n\text{-Mod}^{\text{gr}} \simeq \text{Ind}(\mathcal{A}_n\text{-Mod}^{\text{gr,perf}})$. In other words, they are co-represented by ind-objects (which happens to be coherent)!

Recall the functor

$$\widetilde{\text{triv}}_\theta := \text{Sym}^n V[-1] \otimes \text{triv}_\theta : \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \mathcal{A}_n\text{-Mod}^{\text{gr,coh}},$$

where triv_θ sends a perfect $\bar{\mathcal{A}}_n$ complex to a coherent object where θ act by 0. This functor has a partially defined right adjoint

$$\widetilde{\text{inv}}_\theta := \text{Sym}^n V^\vee[1] \otimes \text{inv}_\theta : \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}},$$

where $\mathcal{A}_n\text{-Mod}^{\text{gr,perf}}$ is naturally a full subcategory of $\mathcal{A}_n\text{-Mod}^{\text{gr,coh}}$. This pair of partial adjoints comes from the standard adjunction pair $\text{triv}_\theta \dashv \text{inv}_\theta$ between the Ind-completed categories $\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr}} = \text{Ind}(\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}})$ and $\text{Ind}(\mathcal{A}_n\text{-Mod}^{\text{gr,coh}})$.

Remark 5.3.18 (abuse of notation). In what follows, we will abuse notation and implicitly view objects of $\mathcal{A}_n\text{-Mod}^{\text{gr,perf}}$ as living in $\mathcal{A}_n\text{-Mod}^{\text{gr,coh}}$ whenever necessary. For example, when $c \in \mathcal{A}_n\text{-Mod}^{\text{gr,coh}}$ and $p \in \mathcal{A}_n\text{-Mod}^{\text{gr,perf}}$, we write

$$\mathcal{H}\text{om}_{\mathcal{A}_n\text{-Mod}^{\text{gr,coh}}}^{\text{gr}}(c, p) := \mathcal{H}\text{om}_{\mathcal{A}_n\text{-Mod}^{\text{gr,coh}}}^{\text{gr}}(c, \iota_{\text{perf} \hookrightarrow \text{coh}} p),$$

where $\iota_{\text{perf} \hookrightarrow \text{coh}} : \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} \hookrightarrow \mathcal{A}_n\text{-Mod}^{\text{gr,coh}}$ is the natural inclusion.

In view of Corollaries 5.3.14 and 5.3.16, we have the following analog of Proposition 5.3.12 for Γ .

Proposition 5.3.19. *The a -degree a part Γ_a of Γ is given by*

$$\Gamma_a \simeq \mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,coh}}}^{\text{gr}}(\wedge^a P \otimes \text{Sym}^n V[-1] \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], -) : \mathcal{A}_n\text{-Mod}^{\text{gr,perf}} \rightarrow \text{Vect}^{\text{gr}},$$

where the degree (X, C) in Vect^{gr} corresponds to $(X, C-X)$ in the Q, T -grading. Here, X is the graded degree and C is the cohomological degree in Vect^{gr} .

Proof. Using the adjunction $\widetilde{\text{triv}}_\theta \dashv \widetilde{\text{inv}}_\theta$ discussed above, for any $M \in \mathcal{A}_n\text{-Mod}^{\text{gr,perf}}$, we have

$$\begin{aligned} \Gamma_a(M) &\simeq \mathcal{H}\text{om}_{\bar{\mathcal{A}}_n\text{-Mod}^{\text{gr,perf}}}^{\text{gr}}(\wedge^a P \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], \widetilde{\text{inv}}_\theta M) \\ &\simeq \mathcal{H}\text{om}_{\mathcal{A}_n\text{-Mod}^{\text{gr,coh}}}^{\text{gr}}(\wedge^a P \otimes \widetilde{\text{triv}}_\theta(\bar{\mathbb{Q}}_\ell[\underline{x}]), M) \\ &\simeq \mathcal{H}\text{om}_{\mathcal{A}_n\text{-Mod}^{\text{gr,coh}}}^{\text{gr}}(\wedge^a P \otimes \text{Sym}^n V[-1] \otimes \bar{\mathbb{Q}}_\ell[\underline{x}], M), \end{aligned}$$

and the proof concludes. \square

We are now ready to state the main theorem of this subsection, which is a direct consequence of the results proved so far.

Theorem 5.3.20. *The a -degree part $\widetilde{\mathrm{HH}}_a$ of $\widetilde{\mathrm{HH}}$ is given by*

$$\widetilde{\mathrm{HH}}_a \simeq \mathcal{H}\mathrm{om}_{\mathcal{A}_n\text{-Mod}^{\mathrm{gr},\mathrm{coh}}}(\wedge^a P \otimes \mathrm{Sym}^n V[-1] \otimes \overline{\mathbb{Q}}_\ell[\underline{x}], \mathrm{tr}(-)) : \mathrm{H}_n^{\mathrm{gr}} \rightarrow \mathrm{Vect}^{\mathrm{gr}},$$

where the degree (X, C) corresponds to $(X, C - X)$ in the Q, T -grading, where X is the graded degree and C is the cohomological degree in $\mathrm{Vect}^{\mathrm{gr}}$.

Proof. This follows directly from the computation of Γ_a in Proposition 5.3.19 and the fact that $\widetilde{\mathrm{HH}}_a = \Gamma_a \circ \mathrm{tr}$ (see Definition 5.3.13 and Corollary 5.3.14). \square

5.4. HOMFLY-PT homology via $\mathrm{Hilb}(\mathbb{C}^2)$. We will now finally establish the realization of HOMFLY-PT homology via Hilbert schemes of points on \mathbb{C}^2 . The main point is to transport Theorem 5.3.20 to the Hilbert scheme side via Koszul duality and the result of Krug as encapsulated in §4.

5.4.1. Koszul duality. We will now reformulate Theorem 5.3.20 using Koszul duality, which is an equivalence of categories (4.1.7). We start with the following matching of objects

Lemma 5.4.2. *Under the equivalence of categories (4.1.7), we have the following matching of objects*

$$\begin{aligned} \widetilde{\mathrm{inv}}_\theta^{\mathrm{enh}}(\wedge^a P \otimes \mathrm{Sym}^n V[-1] \otimes \overline{\mathbb{Q}}_\ell[\underline{x}]) &\simeq \wedge^a P \otimes \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}] \\ &\simeq \wedge^a P \otimes \mathrm{Sym}(V_x[-2] \oplus V_y^\vee) \in \mathcal{B}_n\text{-Mod}^{\mathrm{gr},\mathrm{perf}}. \end{aligned}$$

Proof. Directly from the construction (see also §4.1.5), we have

$$\mathrm{inv}_\theta^{\mathrm{enh}}(\overline{\mathbb{Q}}_\ell[\underline{x}]) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}].$$

Thus,

$$\widetilde{\mathrm{inv}}_\theta^{\mathrm{enh}}(\overline{\mathbb{Q}}_\ell[\underline{x}]) := \mathrm{Sym}^n V^\vee[1] \otimes \mathrm{inv}_\theta^{\mathrm{enh}}(\overline{\mathbb{Q}}_\ell[\underline{x}]) \simeq \mathrm{Sym}^n V^\vee[1] \otimes \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}].$$

Since all functors involved are linear over $\overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$, we get

$$\widetilde{\mathrm{inv}}_\theta^{\mathrm{enh}}(\wedge^a P \otimes \mathrm{Sym}^n V[-1] \otimes \overline{\mathbb{Q}}_\ell[\underline{x}]) \simeq \wedge^a P \otimes \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}] \in \mathcal{B}_n\text{-Mod}^{\mathrm{gr},\mathrm{perf}},$$

and the proof concludes. \square

Corollary 5.4.3. *The a -degree part $\widetilde{\mathrm{HH}}_a$ of $\widetilde{\mathrm{HH}}$ is given by the cohomology of*

$$\widetilde{\mathrm{HH}}_a(R_\beta) \simeq \mathcal{H}\mathrm{om}_{\mathcal{B}_n\text{-Mod}^{\mathrm{gr},\mathrm{perf}}}(\wedge^a P \otimes \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{y}], \widetilde{\mathrm{inv}}_\theta^{\mathrm{enh}}(\mathrm{tr}(R_\beta))) \in \mathrm{Vect}^{\mathrm{gr}}$$

where the degree (X, C) corresponds to $(X, C - X)$ in the Q, T -grading. Here, X is the graded degree and C is the cohomological degree in $\mathrm{Vect}^{\mathrm{gr}}$.

Proof. This is simply Theorem 5.3.20 transported to $\mathcal{B}_n\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$ using the equivalence of categories (4.1.7) and the matching of objects done in Lemma 5.4.2. \square

5.4.4. HOMFLY-PT homology via 2-periodized Hilbert schemes. We will now relate HOMFLY-PT homology and 2-periodized Hilbert schemes of points. Since there are now more than one gradings, we will include them in the notation. Recall that on the $\mathcal{B}_n\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$ side, there are two sets of gradings: X, Y and \tilde{X}, \tilde{Y} . Here, X is the original grading coming from graded sheaves whereas Y is the extra grading (to be “canceled out” by 2-periodization). Moreover, the \tilde{X}, \tilde{Y} -grading are related to the X, Y -grading via a simple change of coordinates. See §§4.4.1 & 4.4.6.

Definition 5.4.5. We define

$$\widetilde{\mathrm{HH}}_a^{\mathrm{per}} : \mathrm{H}_n^{\mathrm{gr}} \rightarrow \overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}]\text{-Mod}^{\mathrm{gr}_X, \mathrm{gr}_Y} =: \mathrm{Vect}^{\mathrm{gr}_X, \mathrm{gr}_Y, \mathrm{per}} \simeq \mathrm{Vect}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}, \mathrm{per}}$$

by $\overline{\mathbb{Q}}_\ell[\beta, \beta^{-1}] \otimes \widetilde{\mathrm{HH}}_a$, where β lives in cohomological degree -2 and X, Y -degree $(0, 1)$. See §4.4.8 for the various definitions and grading conventions for 2-periodization.

We note that $\widetilde{\mathrm{HH}}_a^{\mathrm{per}}$ and $\widetilde{\mathrm{HH}}_a$ contain the same amount of information. The introduction of 2-periodization allows to introduce a formal grading Y that is twice the cohomological degree. For example, the $Y = l$ part of $H^0(\widetilde{\mathrm{HH}}_a^{\mathrm{per}}(-))$ is precisely $H^{2l}(\widetilde{\mathrm{HH}}_a(-))$. In this precise sense, we have $Y = C^2$ (in multiplicative notation) if we use C to denote the cohomological degree. All the cohomology groups of $\widetilde{\mathrm{HH}}_a$ can then be recovered by looking only at H^0 and H^1 of $\widetilde{\mathrm{HH}}_a^{\mathrm{per}}$.

Theorem 5.4.6 ([GKS, Conjecture 7.2.(a)]). *We have the following equivalence of functors from $H_n^{\mathrm{gr}} \rightarrow \mathrm{Vect}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}, \mathrm{per}}$*

$$\widetilde{\mathrm{HH}}_a^{\mathrm{per}} \simeq \mathcal{H}\mathrm{om}_{\mathrm{Perf}(\mathrm{Hilb}_n / \mathbb{G}_m^2)^{\mathrm{per}}}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}}((\wedge^a \mathcal{T})^{\mathrm{per}}, \Psi^{\mathrm{per}}(\widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(-))^{\mathrm{per}})),$$

where \mathcal{T} is the tautological bundle on Hilb_n . The \tilde{X}, \tilde{Y} -grading matches with the q, t -grading as follows: $\tilde{X} = q$, $\tilde{Y} = \sqrt{t}$. Moreover, the cohomological degree C on the RHS corresponds to \sqrt{qt} . Note also that for any $R \in H_n^{\mathrm{gr}}$, $\Psi^{\mathrm{per}}(\widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(R))^{\mathrm{per}}) \in \mathrm{Perf}(\mathrm{Hilb}_n / \mathbb{G}_m^2)_{\mathrm{Hilb}_{n, \tilde{x}}^{\mathrm{per}}}$, i.e., it is supported along the x -axis.

In particular, for any $R_{\beta} \in H_n^{\mathrm{gr}}$ associated to a braid β , there exists a natural

$$\mathcal{F}_{\beta} := \Psi^{\mathrm{per}}(\widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(R_{\beta}))^{\mathrm{per}}) \in \mathrm{Perf}(\mathrm{Hilb}_n / \mathbb{G}_m^2)_{\mathrm{Hilb}_{n, \tilde{x}}^{\mathrm{per}}}$$

such that the a -degree a component of the HOMFLY-PT homology of β is given by

$$\mathcal{H}\mathrm{om}_{\mathrm{Perf}(\mathrm{Hilb}_n / \mathbb{G}_m^2)^{\mathrm{per}}}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}}(\wedge^a \mathcal{T}^{\mathrm{per}}, \mathcal{F}_{\beta}).$$

Proof. For any $R \in H_n^{\mathrm{gr}}$, we have the following natural equivalences

$$\begin{aligned} \widetilde{\mathrm{HH}}_a^{\mathrm{per}}(R) &:= \overline{\mathbb{Q}}_{\ell}[\beta, \beta^{-1}] \otimes \widetilde{\mathrm{HH}}_a(R) \\ \text{(Corollary 5.4.3)} \quad &\simeq \overline{\mathbb{Q}}_{\ell}[\beta, \beta^{-1}] \otimes \mathcal{H}\mathrm{om}_{\mathcal{B}_n\text{-Mod}^{\mathrm{gr}, \mathrm{per}}}^{\mathrm{gr}_{\tilde{X}}}(\wedge^a P \otimes \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{y}], \widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(R))) \\ \text{(Lemma 4.4.2)} \quad &\simeq \mathcal{H}\mathrm{om}_{\Rightarrow(\mathcal{B}_n\text{-Mod}^{\mathrm{gr}, \mathrm{per}})}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}}(\wedge^a P \otimes \overline{\mathbb{Q}}_{\ell}[\underline{x}, \underline{y}], \widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(R))) \\ \text{(Corollary 4.4.5)} \quad &\simeq \mathcal{H}\mathrm{om}_{\mathcal{B}_n\text{-Mod}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}, \mathrm{per}, \mathrm{per}}}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}}((\wedge^a T)^{\mathrm{per}}, (\widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(R)))^{\mathrm{per}}) \\ \text{(Theorem 4.4.15 and Corollary 4.5.6)} \quad &\simeq \mathcal{H}\mathrm{om}_{\mathrm{Perf}(\mathrm{Hilb}_n / \mathbb{G}_m^2)^{\mathrm{per}}}^{\mathrm{gr}_{\tilde{X}}, \mathrm{gr}_{\tilde{Y}}}((\wedge^a \mathcal{T})^{\mathrm{per}}, \Psi^{\mathrm{per}}(\widetilde{\mathrm{inv}}_{\theta}^{\mathrm{enh}}(\mathrm{tr}(R))^{\mathrm{per}})). \end{aligned}$$

Note that as before, we implicitly passed from X, Y -grading to \tilde{X}, \tilde{Y} -grading.

For the matching of gradings, observe that $\tilde{X}^k \tilde{Y}^l = X^{2k} Y^l X^{-l} = X^{2k-l} C^{2k}$ corresponds to

$$Q^{2k-l} T^{2k-2k+l} = Q^{2k-l} T^l = Q^{2k} Q^{-l} T^l = q^k (\sqrt{t})^l.$$

in the q, t -degree. In other words, \tilde{X}, \tilde{Y} -grading corresponds to q, \sqrt{t} -grading precisely. Moreover, cohomological degree 1, which is C , corresponds to

$$T = QQ^{-1}T = \sqrt{qt}.$$

□

Remark 5.4.7. When decategorified, a term in cohomological degree 1 of $\widetilde{\mathrm{HH}}_a^{\mathrm{per}}$ contributes a factor of $-\sqrt{qt}$. The sign is there because of the odd cohomological degree.

5.5. Matching the actions of $\overline{\mathbb{Q}}_{\ell}[\underline{x}]^{\mathrm{S}_n}$. In [GKS, §5.1], an action of the variables \underline{x} (or equivalently, \tilde{x} , depending on whether we are working with the sheared or the 2-periodized version) on HH is constructed. In particular, symmetric functions on \underline{x} (or equivalently, \tilde{x}) also act. On the other hand, by construction, the geometric realization of $\widetilde{\mathrm{HH}}^{\mathrm{per}}$ via Hilbert schemes in Theorem 5.4.6 automatically equips it with an action of $\overline{\mathbb{Q}}_{\ell}[\tilde{x}, \tilde{y}]^{\mathrm{S}_n} = H^0(\mathrm{Hilb}_n, \mathcal{O})$. In particular, it admits an action of $\overline{\mathbb{Q}}_{\ell}[\tilde{x}]^{\mathrm{S}_n} \subset \overline{\mathbb{Q}}_{\ell}[\tilde{x}, \tilde{y}]^{\mathrm{S}_n}$.

This subsection is dedicated to showing the following result, whose proof will conclude in §5.5.16.

Theorem 5.5.1 (part of [GKS, Conjecture 7.2.(b)]). *The two actions above coincide.*

The proof is a simple matter of chasing through the construction. To keep the main ideas evident, we will elide the difference between sheared and 2-periodic versions. For example, we will pass seamlessly between $\underline{x}, \underline{y}$ and \tilde{x}, \tilde{y} .

The argument can be most conceptually and conveniently phrased in terms of module categories. For example, instead of saying that a (graded) commutative ring R acts on objects of a $(\text{Vect}^{\text{gr}}\text{-module})$ category \mathcal{C} , we formulate everything in terms of the symmetric monoidal category $\mathcal{O} = R\text{-Mod}$ (or $\mathcal{O} = R\text{-Mod}^{\text{gr}}$) acting on \mathcal{C} itself. Then, the core of the argument revolves around observing that all functors involved are linear over \mathcal{O} .

5.5.2. Module categories and actions of a commutative ring. We start with some generalities regarding module categories and actions of commutative rings.

Let \mathcal{O} and \mathcal{O}' be compactly generated rigid symmetric monoidal categories equipped with a symmetric monoidal functor $F : \mathcal{O} \rightarrow \mathcal{O}'$ and a right adjoint G , which is necessarily right-lax symmetric monoidal. The symmetric monoidal functor F equips \mathcal{O}' with the structure of a \mathcal{O} -module category. F can thus be written as $F = - \otimes_{\mathcal{O}}$. The functor G can thus be written as $G \simeq \mathcal{H}\text{om}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'}, -)$, where the superscript \mathcal{O} in $\mathcal{H}\text{om}$ denotes the \mathcal{O} -enriched Hom . See [HLb, §3.2.6] for a quick review on enriched Hom -spaces.

Lemma 5.5.3. *Let \mathcal{O} and \mathcal{O}' be as above, and \mathcal{C} an \mathcal{O}' -module category. Then, for any $c_1, c_2 \in \mathcal{C}$, $\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}}(c_1, c_2)$ has a natural $\mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'})$ -module structure. Moreover, this module structure is compatible with*

- (i) *\mathcal{O}' -linear functors: if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a morphism of \mathcal{O}' -module categories, then $\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}}(c_1, c_2) \rightarrow \mathcal{H}\text{om}_{\mathcal{D}}^{\mathcal{O}}(F(c_1), F(c_2))$ is a morphism of modules over $\mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'})$;*
- (ii) *the restriction of structure via a symmetric monoidal functor $F' : \mathcal{O}' \rightarrow \mathcal{O}''$: if the \mathcal{O}' -module structure on \mathcal{C} comes restricting an \mathcal{O}'' -module structure, then the $\mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'})$ -module structure on $\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}}(c_1, c_2)$ is obtained by restriction of scalars along the commutative algebra map $\mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'}) \rightarrow \mathcal{E}\text{nd}_{\mathcal{O}''}^{\mathcal{O}}(1_{\mathcal{O}''})$.*

Proof. We have $\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}'}(c_1, c_2) \in \mathcal{O}'$ and thus, it naturally has a module structure over $1_{\mathcal{O}'}$. Since G is right-lax symmetric monoidal, $G\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}'}(c_1, c_2)$ has a natural module structure over $G(1_{\mathcal{O}'}) \simeq \mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'})$. But, by adjunction, $G\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}'}(c_1, c_2) \simeq \mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}}(c_1, c_2)$ and we are done.

The second part regarding various compatibilities is an easy diagram chase. \square

Lemma 5.5.4. *Let \mathcal{O} , \mathcal{O}' , and \mathcal{C} be as above. Then, for any c , there is a natural map of algebra objects in \mathcal{O}*

$$\varphi_c : \mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'}) \rightarrow \mathcal{E}\text{nd}_{\mathcal{C}}^{\mathcal{O}}(c).$$

Moreover, this map is compatible with \mathcal{O}' -linear functors and with restriction of structure via a symmetric monoidal functor $\mathcal{O}' \rightarrow \mathcal{O}''$.

Proof. $\mathcal{E}\text{nd}_{\mathcal{C}}^{\mathcal{O}'}(c)$ is an algebra object in \mathcal{O}' and hence, it receives a natural algebra map from $1_{\mathcal{O}'}$ since $1_{\mathcal{O}'}$ is the initial algebra object. Applying G to this map, we obtained the desired map of algebras in \mathcal{O} .

The second part follows from Lemma 5.5.3. \square

Remark 5.5.5. In the case where $\mathcal{O} = \text{Vect}$ (resp. $\mathcal{O} = \text{Vect}^{\text{gr}}$), Lemma 5.5.4 states that any object $c \in \mathcal{C}$ admits a natural action (resp. a graded action) of $\mathcal{E}\text{nd}_{\mathcal{O}'}(1_{\mathcal{O}'})$ (resp. $\mathcal{E}\text{nd}_{\mathcal{O}'}^{\text{gr}}(1_{\mathcal{O}'})$).

Corollary 5.5.6. *Let \mathcal{O} , \mathcal{O}' , and \mathcal{C} be as above. Then, for any $c_1, c_2 \in \mathcal{C}$, the action of $\mathcal{E}\text{nd}_{\mathcal{O}'}^{\mathcal{O}}(1_{\mathcal{O}'})$ on $\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}}(c_1, c_2)$ factors through $\mathcal{E}\text{nd}_{\mathcal{C}}^{\mathcal{O}}(c_1)^{\text{rev}}$ and $\mathcal{E}\text{nd}_{\mathcal{C}}^{\mathcal{O}}(c_2)$. Here, the superscript rev denotes the reverse multiplication.*

Proof. Since $1_{\mathcal{O}'}$ is the initial algebra object in \mathcal{O}' , the action of $1_{\mathcal{O}'}$ on $\mathcal{H}\text{om}_{\mathcal{C}}^{\mathcal{O}'}(c_1, c_2)$ factors through the natural actions of $\mathcal{E}\text{nd}_{\mathcal{C}}^{\mathcal{O}'}(c_1)^{\text{rev}}$ and $\mathcal{E}\text{nd}_{\mathcal{C}}^{\mathcal{O}'}(c_2)$. Applying G , we obtain the desired conclusion. \square

In what follows, we will apply the statements above to the case where $\mathcal{O}' = R\text{-Mod}^{\text{gr}}$ for some commutative ring R and $\mathcal{O} = \text{Vect}^{\text{gr}}$. Moreover, F is the functor of taking free R -modules and G is the forgetful functor.

Remark 5.5.7. In the situations that we are interested in, the functor F and all the actions (in various module category structures) are compact-preserving. Note, however, that G does not preserve compactness. Thus, when working with the small full subcategory spanned by compact objects, Lemmas 5.5.3 and 5.5.4 and Corollary 5.5.6 still apply, except that the enriched Hom's are not necessarily compact.

5.5.8. *The action of $\overline{\mathbb{Q}}_\ell[x]$ on HHH.* We will now recast the action of $\overline{\mathbb{Q}}_\ell[x]$ on HHH as described in [GKS, §5.1] in the categorical language above. To start, observe that $H_n^{\text{gr}} \simeq \text{Shv}_{\text{gr},c}(BB \times_{BG} BB)$ has an action of $\text{Shv}_{\text{gr},c}(BB \times BB) \simeq \overline{\mathbb{Q}}_\ell[x]^{\otimes 2}\text{-Mod}^{\text{gr},\text{perf}}$ where the two factors act on the left and the right, respectively. The usual action of $\overline{\mathbb{Q}}_\ell[x]^{\otimes 2}$ on any $R \in H_n^{\text{gr}}$ (i.e., any Soergel bimodule) can thus be recovered from Lemma 5.5.3. Note also that the commutative diagram

$$\begin{array}{ccc} BB \times_{BG} BB & \longrightarrow & BB \\ \downarrow & & \downarrow \\ BB & \longrightarrow & BG \end{array}$$

implies that the induced actions of $\text{Shv}_{\text{gr},c}(BG) \simeq C_{\text{gr}}^*(BG)\text{-Mod}^{\text{gr},\text{perf}} \simeq \overline{\mathbb{Q}}_\ell[x]^{S_n}\text{-Mod}^{\text{gr},\text{perf}}$ via these two actions (on the left and on the right) agree. In particular, the two actions of $C_{\text{gr}}^*(BG)$ on any $R \in H_n^{\text{gr}}$ obtained from restricting the two actions of $C_{\text{gr}}^*(BB)$ along $C_{\text{gr}}^*(BG) \rightarrow C_{\text{gr}}^*(BB)$ agree (see also [GKS, Lemma 5.1]).

5.5.9. *Reducing to the weight heart.* By construction, HHH is obtained by applying Hochschild homology term-wise (via the weight complex functor) to an element $R \in H_n^{\text{gr}}$. This was formulated geometrically in §5.2.1. Since all the categorical actions are weight exact, for the purpose of describing the action of $\overline{\mathbb{Q}}_\ell[x]$ on HHH, we can assume that $R \in H_n^{\text{gr},\heartsuit_w}$ and forget about the weight complex functor. The action of $\overline{\mathbb{Q}}_\ell[x] \simeq C_{\text{gr}}^*(BB)$ on $\text{HHH}(R)$ can thus be obtained by applying Lemma 5.5.3 where $\mathcal{O} = \text{Vect}^{\text{gr}}$, $\mathcal{O}' = \text{Shv}_{\text{gr}}(BB)^{\text{ren}}$, $\mathcal{C} = \text{Shv}_{\text{gr}}(\frac{G}{B})^{\text{ren}}$, $c_1 = \overline{\mathbb{Q}}_{\ell,\frac{G}{B}}$, and $c_2 = p^*R$. Indeed, this is because $\text{HHH}(R)$ is given by (the cohomology of)

$$C_{\text{gr}}^*(BB, \pi_* p^* R) \simeq \mathcal{H}\text{om}_{\text{Shv}_{\text{gr},c}(\frac{G}{B})}^{\text{gr}}(\overline{\mathbb{Q}}_{\ell,\frac{G}{B}}, p^* R).$$

5.5.10. *The action of $\overline{\mathbb{Q}}_\ell[x]^{S_n}$ on HHH.* We can restrict the action of $\overline{\mathbb{Q}}_\ell[x]$ on HHH to $\overline{\mathbb{Q}}_\ell[x]^{S_n} \subseteq \overline{\mathbb{Q}}_\ell[x]$ and obtain an action of $\overline{\mathbb{Q}}_\ell[x]^{S_n}$, which is the action described in [GKS]. We will now realize this action more geometrically. We start with the following result.

Lemma 5.5.11. *For $R \in H_n^{\text{gr},\heartsuit_w}$, the action of $\overline{\mathbb{Q}}_\ell[x]^{S_n} = C_{\text{gr}}^*(BG)$ on $\text{HHH}(R) = H^*(\mathcal{H}\text{om}_{\text{Shv}_{\text{gr},c}(\frac{G}{B})}^{\text{gr}}(\overline{\mathbb{Q}}_\ell, p^* R))$ is given by the $\text{Shv}_{\text{gr},c}(BG)$ -module structure on $\text{Shv}_{\text{gr},c}(\frac{G}{B})$ via Lemma 5.5.3, where the former acts via pulling back along $\frac{G}{B} \rightarrow BB \rightarrow BG$.*

Proof. By definition, the $C_{\text{gr}}^*(BG)$ -action is given by restricting along $C_{\text{gr}}^*(BG) \rightarrow C_{\text{gr}}^*(BB)$. The result thus follows by applying Lemma 5.5.3.(ii) to the case where $\mathcal{O} = \text{Vect}^{\text{gr}}$, $\mathcal{O}' = \text{Shv}_{\text{gr}}(BG)^{\text{ren}}$, $\mathcal{O}'' = \text{Shv}_{\text{gr}}(BB)^{\text{ren}}$, $\mathcal{C} = \text{Shv}_{\text{gr}}(\frac{G}{B})^{\text{ren}}$, $c_1 = \overline{\mathbb{Q}}_{\ell,\frac{G}{B}}$, and c_2 is p^*R . \square

Lemma 5.5.12. *For $R \in H_n^{\text{gr},\heartsuit_w}$, the action of $C_{\text{gr}}^*(BG)$ on $\text{HHH}(R)$ described above agrees with the one coming from the $\text{Shv}_{\text{gr},c}(BG)$ -module structure on $\text{Shv}_{\text{gr},c}(G/G)$ via Lemma 5.5.3 and the equivalence*

$$\text{HHH}(R) = H^*(\mathcal{H}\text{om}_{\text{Shv}_{\text{gr},c}(\frac{G}{G})}^{\text{gr}}(\overline{\mathbb{Q}}_{\ell,\frac{G}{G}}, q_* p^* R)) \simeq H^*(\mathcal{H}\text{om}_{\text{Ch}_G^{\text{u,gr}}}^{\text{gr}}(\overline{\mathbb{Q}}_{\ell,\frac{G}{G}}, \text{tr}(R))).$$

Proof. Consider the following (non-Cartesian) commutative square

$$\begin{array}{ccc}
 & \frac{G}{B} & \\
 p \swarrow & & \searrow q \\
 BB \times_{BG} BB & & \frac{G}{G} \\
 & \searrow & \swarrow \\
 & BG &
 \end{array}$$

where p and q form the horocycle correspondence. Note that p^* and q^* are $\mathrm{Shv}_{\mathrm{gr},c}(BG)$ -linear. By rigidity of $\mathrm{Shv}_{\mathrm{gr},c}(BG)$, p_* and q_* are also $\mathrm{Shv}_{\mathrm{gr},c}(BG)$ -linear. But now, we have a natural equivalence

$$\begin{aligned}
 \mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr}}(\frac{G}{B})^{\mathrm{ren}}}^{\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}}(\overline{\mathbb{Q}}_\ell, p^*R) &\simeq \mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr}}(\frac{G}{B})^{\mathrm{ren}}}^{\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}}(q^*\overline{\mathbb{Q}}_\ell, p^*R) \\
 &\simeq \mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr}}(\frac{G}{G})^{\mathrm{ren}}}^{\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}}(\overline{\mathbb{Q}}_\ell, q_*p^*R) \in \mathrm{Shv}_{\mathrm{gr},c}\left(\frac{G}{G}\right) \subseteq \mathrm{Shv}_{\mathrm{gr}}\left(\frac{G}{G}\right)^{\mathrm{ren}}.
 \end{aligned}$$

The proof concludes by applying $\mathcal{H}\mathrm{om}_{\mathrm{Shv}_{\mathrm{gr},c}(\frac{G}{G})}^{\mathrm{gr}}(\overline{\mathbb{Q}}_\ell, -)$ as in Lemma 5.5.3 and using Lemma 5.5.11. \square

The action above has a more explicit description in terms of Theorem 3.3.4. We start with the following result.

Lemma 5.5.13. *We have an equivalence of $\overline{\mathbb{Q}}_\ell[x]^{S_n}\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$ -module categories (or equivalently, of $\mathrm{Shv}_{\mathrm{gr},c}(BG)$ -module categories)*

$$\mathrm{Hom}_{\mathrm{Ch}_G^{\mathrm{gr}}}^{\mathrm{gr}}(\mathrm{Spr}_G^{\mathrm{gr}}, -) : \mathrm{Ch}_G^{\mathrm{u},\mathrm{gr}} \xrightarrow{\simeq} \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$$

where the $\mathrm{Shv}_{\mathrm{gr},c}(BG)$ -module structure on the left is inherited from the embedding $\mathrm{Ch}_G^{\mathrm{u},\mathrm{gr}} \hookrightarrow \mathrm{Shv}_{\mathrm{gr},c}(\frac{G}{G})$ and where the $C_{\mathrm{gr}}^*(BG)\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$ -module structure on the right comes from the natural morphism of algebras

$$(5.5.14) \quad \overline{\mathbb{Q}}_\ell[x]^{S_n} \simeq C_{\mathrm{gr}}^*(BG) \simeq \mathcal{E}\mathrm{nd}_{\mathrm{Shv}_{\mathrm{gr},c}(BG)}^{\mathrm{gr}}(\overline{\mathbb{Q}}_\ell) \rightarrow \mathcal{E}\mathrm{nd}_{\mathrm{Ch}_G^{\mathrm{u},\mathrm{gr}}}^{\mathrm{gr}}(\mathrm{Spr}_G^{\mathrm{gr}}) \simeq \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n],$$

given by Lemma 5.5.4. Moreover, this morphism of algebra is the obvious one, given by the embedding of symmetric polynomials on x to all polynomials.

Proof. Instead of running the proof of Theorem 3.3.4 relatively over $\mathrm{Vect}^{\mathrm{gr}}$, we could have run it relatively over $\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}$. Then, we obtain an equivalence of $\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}$ -module categories (or equivalently, of $\overline{\mathbb{Q}}_\ell[x]^{S_n}$ -module categories)

$$\mathrm{Ch}_G^{\mathrm{u},\mathrm{gr},\mathrm{ren}} \xrightarrow{\simeq} \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}(\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}) \simeq \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}(\overline{\mathbb{Q}}_\ell[x]^{S_n}\text{-Mod}),$$

where the category on the right hand side is formed using the natural morphism of algebras (5.5.14), by Corollary 5.5.6. Note also that the equivalence of categories in Theorem 3.3.4 is obtained by further composing with the forgetful functor

$$\begin{aligned}
 \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}(\mathrm{Shv}_{\mathrm{gr}}(BG)^{\mathrm{ren}}) &\simeq \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}(\overline{\mathbb{Q}}_\ell[x]^{S_n}\text{-Mod}) \\
 &\xrightarrow{\text{forgetful}} \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}(\mathrm{Vect}^{\mathrm{gr}}) \simeq \overline{\mathbb{Q}}_\ell[x, \theta] \boxtimes \overline{\mathbb{Q}}_\ell[S_n]\text{-Mod}^{\mathrm{gr}}.
 \end{aligned}$$

Now, observe that the forgetful functor is in fact an equivalence of categories. The proof of the first part thus concludes.

We will compute the morphism (5.5.14) explicitly, as stated in the last sentence of the lemma. Consider the following (non-Cartesian) commutative diagram

$$\begin{array}{ccc}
 \frac{B}{B} & \xrightarrow{q} & \frac{G}{G} \\
 \downarrow h & & \downarrow h \\
 BB & \xrightarrow{q} & BG.
 \end{array}$$

Now, applying Lemma 5.5.4 and the fact that $\text{Spr}_G^{\text{gr}} \simeq q_* \overline{\mathbb{Q}}_\ell$, we see that the natural algebra morphism

$$C_{\text{gr}}^*(BG) \simeq \mathcal{E}nd_{\text{Shv}_{\text{gr},c}(BG)}^{\text{gr}}(\overline{\mathbb{Q}}_\ell) \rightarrow \mathcal{E}nd_{\text{Shv}_{\text{gr},c}(G/G)}^{\text{gr}}(\text{Spr}_G^{\text{gr}})$$

factors as in the following diagram

$$\begin{array}{ccccccc} C_{\text{gr}}^*(BG) & \longrightarrow & C_{\text{gr}}^*(BB) & \longrightarrow & \mathcal{E}nd_{\text{Shv}_{\text{gr},c}(B/B)}^{\text{gr}}(\overline{\mathbb{Q}}_\ell) & \longrightarrow & \mathcal{E}nd_{\text{Shv}_{\text{gr},c}(G/G)}^{\text{gr}}(\text{Spr}_G^{\text{gr}}) \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ \overline{\mathbb{Q}}_\ell[\underline{x}]^{S_n} & \longrightarrow & \overline{\mathbb{Q}}_\ell[\underline{x}] & \longrightarrow & \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] & \longrightarrow & \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{\theta}] \otimes \overline{\mathbb{Q}}_\ell[S_n], \end{array}$$

where the maps in the bottom row are the obvious ones. The commutativity of the third square is due to Theorem 3.2.1.(iii). The commutativity of the other two squares is obvious. The desired statement then follows from the commutativity of the outer square in the diagram above. \square

We obtain the following refinement of Theorem 4.4.15.

Corollary 5.5.15. *We have an equivalence of $\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}, \text{perf}}$ -module categories*

$$\Rightarrow \text{Ch}_G^{\text{u,gr}} \simeq \widetilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}_{\text{nilp}_{\tilde{y}}}^{\text{gr}, \text{gr}, \text{per}} \xrightarrow[\simeq]{\Psi^{\text{per}}} \text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n, \tilde{x}}}$$

where the $\overline{\mathbb{Q}}_\ell[\underline{x}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}, \text{perf}}$ -module category structure on the first two (resp. last) categories (resp. category) is given by Lemma 5.5.13 (resp. by the Hilbert–Chow map and forgetting the \tilde{y} -variables).

Similarly, we have the corresponding statement for the small category variant by passing to the full subcategories of compact objects.

Proof. Lemma 5.5.13 above, combined with Koszul duality, implies that we have an equivalence of $\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}, \text{perf}}$ -module categories

$$\Rightarrow \text{Ch}_G^{\text{u,gr,ren}} \simeq \widetilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}_{\text{nilp}_{\tilde{y}}}^{\text{gr}, \text{gr}, \text{per}},$$

where on the right, the module structure is induced by the algebra map

$$\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}]^{S_n} \rightarrow \overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}, \underline{\tilde{y}}]^{S_n} \rightarrow \overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}, \underline{\tilde{y}}] \otimes \overline{\mathbb{Q}}_\ell[S_n] =: \widetilde{\mathcal{B}}_n^{\text{gr}},$$

which is geometrically realized as coming from the natural morphism

$$\mathbb{A}^{2n}/S_n \rightarrow \mathbb{A}^{2n} // S_n \rightarrow \mathbb{A}^n // S_n.$$

The commutative diagram (4.2.2) implies that Ψ^{per} is linear over $\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}, \underline{\tilde{y}}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}}$ (see also [Kb, Remark 3.11]), where the $\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}, \underline{\tilde{y}}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}}$ -module category structure is given by the Hilbert–Chow morphism $\text{Hilb}_n \rightarrow \mathbb{A}^{2n} // S_n$. In particular, Ψ^{per} is linear over $\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}}$. Thus, we obtain an equivalence of $\overline{\mathbb{Q}}_\ell[\underline{\tilde{x}}]^{S_n}\text{-Mod}^{\text{gr}, \text{gr}, \text{per}}$ -module categories

$$\widetilde{\mathcal{B}}_n^{\text{gr}}\text{-Mod}_{\text{nilp}_{\tilde{y}}}^{\text{gr}, \text{gr}, \text{per}} \xrightarrow[\simeq]{\Psi^{\text{per}}} \text{QCoh}(\text{Hilb}_n / \mathbb{G}_m^2)^{\text{per}}_{\text{Hilb}_{n, \tilde{x}}}$$

and the proof concludes. \square

5.5.16. Completing the proof of Theorem 5.5.1. In Lemma 5.5.12, we show that the action of $\overline{\mathbb{Q}}_\ell[\underline{x}]^{S_n}$ on HHH as given in [GKS] comes from the $\text{Shv}_{\text{gr},c}(BG)$ -module category structure on $\text{Ch}_G^{\text{u,gr}}$. In Lemma 5.5.13, we show that this module category structure is induced by an explicit map of algebras, which is then used in Corollary 5.5.15 to show that this module structure is compatible with the one on the Hilbert scheme side, where the structure is induced by the Hilbert–Chow morphism. But now, this structure is responsible for the geometric construction of the action of $\overline{\mathbb{Q}}_\ell[\underline{x}]^{S_n}$ on HHH and the proof concludes. \square

5.6. Support of \mathcal{F}_β on Hilb_n . We will now show that for a braid β , the support of \mathcal{F}_β on Hilb_n , where \mathcal{F}_β is as in Theorem 5.4.6, can be bounded above using the number of components of the link associated to β . This is the content of [GKS, Conjecture 7.2.(b) and (c)]. Unlike what is implied over there, however, we do not deduce this as a consequence of Theorem 5.5.1. The obstacle is that Theorem 5.5.1 is a statement about global sections of a sheaf whereas the statement we are after is one about the support *before* taking global sections, which is more local in nature. The route we take is thus via the theory of supports as developed in [BIK; AG], which is inherently local.

As in the previous subsection, to keep the exposition not heavy, we will elide the difference between the 2-periodic and sheared versions of the various categories involved, passing seamlessly between, for instance, $\underline{x}, \underline{y}$ and \tilde{x}, \tilde{y} .

5.6.1. Subspaces of Hilb_n and supports of \mathcal{F}_β . We start with some notation regarding various subspaces of Hilb_n which will appear as supports of \mathcal{F}_β .

Definition 5.6.2. (i) For $\beta \in \text{Br}_n$ a braid on n strands, we define $w_\beta \in S_n$ to be the corresponding permutation.

- (ii) For each $w \in S_n$, we let $\mathbb{A}_w^{2n} \subseteq \mathbb{A}^{2n}$ denote the closed subscheme of \mathbb{A}^{2n} defined by the relations $x_i = x'_{w(i)}$, where $x_1, \dots, x_n, x'_1, \dots, x'_n$ are the coordinates of the \mathbb{A}^{2n} .²⁸
- (iii) We let $\mathbb{A}_w^n := \mathbb{A}_w^{2n} \times_{\mathbb{A}^{2n}} \mathbb{A}^n$ be the closed subscheme of the diagonal \mathbb{A}^n , where $\mathbb{A}^n \rightarrow \mathbb{A}^{2n}$ is the diagonal map. Alternatively, if we let x_i 's denote the coordinates of the diagonal \mathbb{A}^n , then \mathbb{A}_w^n is defined by the relations $x_i = x_{w(i)}$.
- (iv) For each $w \in S_n$, we let \bar{w} denote its conjugacy class, $(\mathbb{A}_w^n) // S_n \subseteq \mathbb{A}^n // S_n$ the image of \mathbb{A}_w^n in $\mathbb{A}^n // S_n$, and $\mathbb{A}_w^n \subseteq \mathbb{A}^n$ the preimage of $(\mathbb{A}_w^n) // S_n$ in \mathbb{A}^n . In other words, \mathbb{A}_w^n is the orbit of \mathbb{A}_w^n under the S_n action and $\mathbb{A}_w^n // S_n$ its GIT quotient.
- (v) For each $w \in S_n$, we let $\text{Hilb}_{n, \bar{w}} \subseteq \text{Hilb}_n$ denote the preimage of $\mathbb{A}_w^n // S_n$ under $\text{Hilb}_n \rightarrow \mathbb{A}^{2n} // S_n \rightarrow \mathbb{A}^n // S_n$ where the first map is the Hilbert–Chow map and the second map is the projection onto the first factor.
- (vi) For each $w \in S_n$, we let $\text{Hilb}_{n, \tilde{x}, \bar{w}}$ be the closed subscheme of Hilb_n fitting in the following Cartesian square

$$\begin{array}{ccccc} \text{Hilb}_{n, \tilde{x}, \bar{w}} & \longrightarrow & \text{Hilb}_{n, \tilde{x}} & \longrightarrow & \text{Hilb}_n \\ \downarrow & & \downarrow & & \downarrow \\ \mathbb{A}_w^n // S_n & \longrightarrow & \mathbb{A}^n // S_n & \longrightarrow & \mathbb{A}^{2n} // S_n, \end{array}$$

where the bottom right horizontal map is induced by $\mathbb{A}^n \simeq \mathbb{A}^n \times \{0\} \rightarrow \mathbb{A}^{2n}$. Equivalently, $\text{Hilb}_{n, \tilde{x}, \bar{w}} = \text{Hilb}_{n, \tilde{x}} \cap \text{Hilb}_{n, \bar{w}}$.

Note that all of these subschemes are stable under the scaling action of \mathbb{G}_m . It thus makes sense to talk about \mathbb{G}_m -equivariant (quasi-)coherent sheaves on these spaces.

Remark 5.6.3. Since these schemes are used for the sole purpose of making statements about set-theoretical supports of (quasi-)coherent sheaves, any possible non-reduced or derived structure is not relevant to us. For definiteness, we take the underlying reduced classical schemes if any non-reduced or derived structure is present.

With the definitions in place, we are now ready to state the main result of this subsection, whose proof will conclude in §5.6.12 below.

Theorem 5.6.4 ([GKS, Conjecture 7.2.(b) and (c)]). *Let β be a braid on n strands and $w_\beta \in S_n$ the associated permutation. Then, $\mathcal{F}_\beta \in \text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)_{\text{Hilb}_{n, \tilde{x}}}^{\text{per}}$ (see Theorem 5.4.6) is set-theoretically supported on $\text{Hilb}_{n, \tilde{x}, \bar{w}_\beta}$, i.e., $\mathcal{F}_\beta \in \text{Perf}(\text{Hilb}_n / \mathbb{G}_m^2)_{\text{Hilb}_{n, \tilde{x}, \bar{w}_\beta}}^{\text{per}}$. In other words, the support can be bounded above using the number of connected components of the link obtained by closing up β .*

²⁸Note that \mathbb{A}_w^{2n} has dimension n ; the superscript is simply to indicate that it is a closed subscheme of \mathbb{A}^{2n} .

5.6.5. *Support in DG-categories.* As in §5.5, the proof is most conceptually explained in terms of module category structures. These structures are naturally in contact with support conditions in the sense of Arinkin–Gaitsgory in [AG].

More precisely, let $\mathcal{O} = \mathcal{A}\text{-Mod}^{\text{gr,perf}}$ be a symmetric monoidal category where \mathcal{A} is a graded commutative (DG) algebra and \mathcal{C} an \mathcal{O} -module category. Consider the commutative algebra $A = \bigoplus_n H^{2n}(\mathcal{A})$ which is doubly graded. Equivalently, $\text{Spec} A$ is equipped with an action of \mathbb{G}_m^2 . Then, for any \mathbb{G}_m^2 -invariant closed subset Y of $\text{Spec} A$, [AG] defines the full subcategory \mathcal{C}_Y of \mathcal{C} consisting of objects supported along Y .

The algebra \mathcal{A} in our cases are of the form $C_{\text{gr}}^*(BB \times BB) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}']$, $C_{\text{gr}}^*(BB) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}]$, and $C_{\text{gr}}^*(BG) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}]^{S_n}$ which are pure and concentrate in only even degrees. The two \mathbb{G}_m actions thus coincide and moreover, the algebra A is simply a shear of \mathcal{A} . We can therefore ignore one of the gradings and the closed subsets Y we will consider are simply \mathbb{G}_m -invariant closed subsets of \mathbb{A}^{2n} , \mathbb{A}^n , and $\mathbb{A}^n // S_n$. These are precisely the ones that appear in Definition 5.6.2.

Remark 5.6.6. Since these are the only cases that we are interested in, we will assume that all of our commutative graded DG-algebras \mathcal{A} used to study supports are pure and concentrated in even degrees.

Remark 5.6.7. Strictly speaking, [AG] works with big categories whereas we formulate everything using small categories. This is not a problem, however, since all of our categories are compactly generated and all actions are compact preserving. Alternatively, we could also just formulate everything using big categories by working with, for example, $H_n^{\text{gr,ren}}$ and $\text{Shv}_{\text{gr}}(BG)^{\text{ren}}$, etc. We chose not to do so since, for example, H_n^{gr} is a much more familiar object than $H_n^{\text{gr,ren}}$.

5.6.8. *Supports of Rouquier complexes.* We will now formulate the support conditions satisfied by Rouquier complexes. Recall that for a braid β on n strands, we use $R_\beta \in H_n^{\text{gr}}$ to denote the associated Rouquier complex. As seen above, $H_n^{\text{gr}} := \text{Shv}_{\text{gr,c}}(BB \times_{BG} BB)$ has a natural module category structure over $\text{Shv}_{\text{gr,c}}(BB \times BB) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}']\text{-Mod}^{\text{gr,perf}}$. By [AG, §3.5 and E.3.2], it makes sense to talk about the support of any element in H_n^{gr} relative to $\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}']\text{-Mod}^{\text{gr,perf}}$. More precisely, given any conical closed subset $Y \subset \mathbb{A}^{2n}$ (with respect to the usual scaling action of \mathbb{G}_m), we can talk about the full subcategory

$$(H_n^{\text{gr}})_Y \simeq H^{\text{gr}} \otimes_{\text{Shv}_{\text{gr,c}}(BB \times BB)} \text{Shv}_{\text{gr,c}}(BB \times BB)_Y \simeq H^{\text{gr}} \otimes_{\overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}']\text{-Mod}^{\text{gr,perf}}} \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}']\text{-Mod}_Y^{\text{gr,perf}} \hookrightarrow H_n^{\text{gr}}$$

of objects supported on Y .

The main computational input is the following result.

Proposition 5.6.9. *Let $\beta \in \text{Br}_n$ be a braid on n strands. Then, $R_\beta \in H_n^{\text{gr}}$ is supported on $\mathbb{A}_{w_\beta}^{2n}$ with respect to the action of $\text{Shv}_{\text{gr,c}}(BB \times BB)$ on H_n^{gr} .*

Proof. This is essentially [GKS, Theorem 5.2] but formulated in a more “local” way. For the sake of completeness, let us also sketch a more geometric proof, which follows the usual strategy. Namely, we decompose β into a product of simple crossings.

We thus start with the case of a single simple crossing β_i . Then w_{β_i} is a simple permutation. Consider the stack $B \backslash Bw_{\beta_i} B / B$. Observe that

$$C_{\text{gr}}^*(B \backslash Bw_{\beta_i} B / B) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}'] / (x_k - x_{w_{\beta_i}(k)}),$$

and hence,

$$\text{Shv}_{\text{gr,c}}(B \backslash Bw_{\beta_i} B / B) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}, \underline{x}'] / (x_k - x_{w_{\beta_i}(k)})\text{-Mod}^{\text{gr,perf}}.$$

Consequently, any object in $\text{Shv}_{\text{gr,c}}(B \backslash Bw_{\beta_i} B / B)$ is supported on $\mathbb{A}_{w_{\beta_i}}^{2n}$, relative to

$$C_{\text{gr}}^*(BB) \otimes C_{\text{gr}}^*(BB)\text{-Mod}^{\text{gr,perf}} \simeq \text{Shv}_{\text{gr,c}}(BB \times BB).$$

Now, let $j_{w_{\beta_i}} : B \backslash Bw_{\beta_i} B / B \rightarrow B \backslash G / B$. Then by rigidity of $\text{Shv}_{\text{gr,c}}(BB \times BB)$,

$$j_{w_{\beta_i},*} j_{w_{\beta_i},!} : \text{Shv}_{\text{gr,c}}(B \backslash Bw_{\beta_i} B / B) \rightarrow \text{Shv}_{\text{gr,c}}(B \backslash G / B)$$

are linear over $\mathrm{Shv}_{\mathrm{gr},c}(BB \times BB)$ and hence, they both preserve supports. In particular, the Rouquier complexes R_{β_i} and $R_{\beta_i^{-1}}$ are both supported on $\mathbb{A}_{w_{\beta_i}}^{2n}$.

For a general braid β , we write $\beta = \beta_1 \dots \beta_m$. Then R_β is obtained using the usual convolution diagram for Hecke categories. The proof concludes by applying [AG, Proposition 3.5.9] to the convolution diagram realizing R_β as a product of R_{β_i} 's. \square

5.6.10. Support of $\mathrm{tr}(R_\beta)$. The rest of the proof of Theorem 5.6.4 is straightforward and follows essentially the same strategy as the one used in §5.5. Namely, it amounts to transporting the support condition on R_β established in Proposition 5.6.9 around to $\mathrm{Ch}_G^{u,\mathrm{gr}}$ and then to Hilb_n . We will now consider the first part.

Corollary 5.6.11. *Let R_β be the Rouquier complex associated to a braid β . Then, the support of $\mathrm{tr}(R_\beta) \in \mathrm{Ch}_G^{u,\mathrm{gr}}$, relative to $\mathrm{Shv}_{\mathrm{gr},c}(BG) \simeq \overline{\mathbb{Q}}_\ell[\underline{x}]^{S_n}\text{-Mod}^{\mathrm{gr},\mathrm{perf}}$, lies inside $\mathbb{A}_{\overline{w}}^n // S_n$.*

Proof. Recall that $\mathrm{tr} = q_! p^*$, where p and q are given in the following diagram

$$\begin{array}{ccccc} BB \times_{BG} BB & \xleftarrow{p} & \frac{G}{B} & \xrightarrow{q} & \frac{G}{G} \\ \downarrow & & \downarrow & & \downarrow \\ BB \times BB & \longleftarrow & BB & \longrightarrow & BG. \end{array}$$

Applying [AG, Proposition 3.5.9] and the fact that supports are preserved under functors compatible with module category structures, we see that $p^* R_\beta$ has support in $\mathbb{A}_{w_\beta}^n := \mathbb{A}_{w_\beta}^{2n} \times_{\mathbb{A}^{2n}} \mathbb{A}^n$ relative to $\mathrm{Shv}_{\mathrm{gr},c}(BB)$, as a consequence of Proposition 5.6.9. Applying [AG, Proposition 3.5.9] again, we see that $p^* R_\beta$ has support $\mathbb{A}_{w_\beta}^n // S_n$ relative to $\mathrm{Shv}_{\mathrm{gr},c}(BG)$. Now, the proof concludes by using the fact that $q_!$ is $\mathrm{Shv}_{\mathrm{gr},c}(BG)$ -linear. \square

5.6.12. Completing the proof of Theorem 5.6.4. We are now ready to complete the proof of Theorem 5.6.4. First, recall that in geometric settings, i.e. when all categories involved are QCoh of Artin stacks of finite type and module category structures are given by pulling back along morphisms of stacks, categorical support in the sense above agrees with the usual notion of set-theoretic support. Thus, it suffices to show that the sheaf \mathcal{F}_β is supported on $\mathbb{A}_{w_\beta}^n // S_n$ relative to $\mathbb{A}^n // S_n$. Indeed, this is equivalent to stating that \mathcal{F}_β is set-theoretically supported on $\mathrm{Hilb}_{n,\overline{w}} \subseteq \mathrm{Hilb}_n$, and hence, also on $\mathrm{Hilb}_{n,\underline{x},\overline{w}} = \mathrm{Hilb}_{n,\underline{x}} \cap \mathrm{Hilb}_{n,\overline{w}}$ since \mathcal{F}_β is known to have support on $\mathrm{Hilb}_{n,\underline{x}}$ by Theorem 5.4.6 already.

But now, by Corollary 5.5.15 and, again, the fact that supports are preserved by functors that are compatible with the module category structures, this support condition is equivalent to the one proved in Corollary 5.6.11 above. The proof thus concludes. \square

ACKNOWLEDGEMENTS

Q. Ho would like to thank the organizers of the workshop on *Categorification in Quantum Topology and Beyond* at the Erwin Schrödinger International Institute for Mathematics and Physics (ESI) in 2019, where he learned about the conjecture in [GNR]. He would also like to thank the organizers of the American Institute of Mathematics's *Link Homology Research Community* for providing a stimulating (online) research environment.

Q. Ho would like to thank Minh-Tam Quang Trinh for many conversations over the years on HOMFLY-PT homology, Paul Wedrich for helpful email exchanges at the initial stage of this project, and Oscar Kivinen for many helpful email exchanges (especially regarding the various grading conventions for HHH) and for pointing out the reference [Kb]. P. Li would like to thank Peng Shan and Yin Tian for many helpful conversations on Soergel bimodules and Hilbert schemes.

Q. Ho is partially supported by Hong Kong RGC ECS grant 26305322. P. Li is partially supported by the National Natural Science Foundation of China (Grant No. 12101348).
